Bills Introduced.—A. 2274 and S. 1998, to amend the public health law, propose provisions governing the furnishing of care and treatment to persons suffering from tuberculosis and diagnostic tests, studies and analyses for the discovery of tuberculosis, without cost or charge to any resident of the state who is suffering from tuberculosis or is suspected of having tuberculosis. A. 2524 is similar to S. 2038, previously reported. To amend the labor law, it proposes the enactment of a disability benefit law. A. 2578 is similar to S. 2238, previously reported. To amend the insurance law, it proposes to remove therefrom the general prohibition against authorizing foreign or alien medical expense indemnity or hospital service corporations from doing business in the state. A. 2580, to amend the education law, proposes the creation by the commissioner of education of a division of psychology to consider curricular adjustments for superior and/or handicapped students. A. 2582, to amend the education law, proposes the granting of a license to practice physiotherapy without examination to persons showing a certificate of honorable discharge from the United States army, navy or marine corps and presenting to the department evidence that at the time of entrance into the military service he was a resident of the state and a graduate in good standing of a legally chartered school or college in the United States teaching physiotherapy, which school required a course of study equivalent to four years of seven months each. A. 2653 and S. 2260 propose the creation of a temporary state commission to make a study and survey of the prevalence and facilities for the treatment of cancer cases within the state. A. 2654 and S. 2218 propose an appropriation to Cornell University for the use of the memorial cancer center fund for cancer research and for the treatment, prevention and care of cancer and allied diseases. A. 2686, to amend the labor law, proposes to redefine the term "total unemployment" to mean the total lack of any employment on any day, caused by the inability of a claimant who is capable of and available for work to engage in his usual employment or in any other form for which he is reasonably fitted by training and experience, except for total lack of any employment on any day or succession of days on account of a condition of pregnancy attested or certified in writing by an attending physician within such time and in such manner as the commissioner shall prescribe, to the extent that such lack of employment on account of a condition of pregnancy is not compensable under any plan or system of benefits or compensation established by the employer. S. 2087 is similar to A. 2377, previously reported. It proposes to authorize corporations organized under the consumers' cooperative stock corporation law for the purpose of furnishing medical expense indemnity service to persons who become subscribers under contracts with such corporations to reincorporate under the membership corporations law. S. 2123 is similar to A. 2395, previously reported. Relating to the creation of a nutrition council, it proposes the creation of a state nutrition council to coordinate all the state's nutritional activities; conduct research or allocate a portion of its funds for research in nutrition; recommend reorganization of the state's nutritional activities; launch a widescale advertising, publicity and promotional campaign of instruction of the elements constituting a sound diet and the proper use of such farm products as may become surplus from time to time; and to do such other things as the council may deem essential for improving the nutritional status of the people.

Bills Passed.—A. 1973 passed the assembly March 13 and the senate March 18. To amend the state licensing law, it proposes that persons lawfully inducted into the military service who were licentiates under the state law at the time of their induction may apply for a renewal of their license within three months of discharge from the service or within three months of discharge from any period of hospitalization in a facility maintained by the United States Veterans Administration. A. 1974 passed the assembly March 13 and the senate March 18. To amend the state licensing law, it proposes to postpone from July 1946 to July 1947 the time during which previous licentiates whose licenses lapsed during military service may have a renewal license without examination. A. 2083 passed the assembly March 18. It proposes to extend the life of the temporary state commission previously appointed to formulate a long-range health program from March 1946 to March 1947. S. 577 passed the assembly March 13. To amend the workmen's compensation law, it proposes that physician members of the industrial council shall not be eligible for authorization to render medical aid under the workmen's compensation law and shall not examine, treat, consult or in any other way care for a compensation claimant at the request either of the claimant or of a carrier. S. 986 passed the assembly March 13. It proposes the creation of a temporary state commission to examine into the need for and to make recommendations relative to the creation of a state university. S. 1000 passed the assembly March 19. To amend the law relating to privileged communications, it proposes the waiver of such privilege by any party in interest in any litigation wherein the interests of the personal representative of the deceased patient are deemed by the trial judge to be adverse to those of the estate. S. 1772 passed the senate March 13. To amend the state licensing law, it proposes to postpone from July 1945 to July 1947 the time during which previous licentiates whose licenses lapsed during military service may have a renewal license without examination. This bill is similar to A. 1974. S. 1773 passed the senate March 13. To amend the state licensing law, it proposes that persons lawfully inducted into the military service who were licentiates under the state law at the time of their induction may apply for a renewal of their license within three months of discharge from the service or within three months of discharge from any period of hospitalization in a facility maintained by the United States Veterans Administration. This bill is similar to A. 1973. S. 1797 passed the senate March 14. To amend the workmen's compensation law, it proposes that physician members of the industrial council shall not be eligible for authorization to render medical care under the act and shall not examine, treat, consult or in any other way care for a compensation claimant at the request either of such claimant or of a carrier. This bill is similar to S. 577. S. 2242, to amend the education law, passed the senate March 20. It proposes to provide for the revocation or annulment of a license to practice medicine for splitting fees in x-ray diagnosis or physiotherapeutic or pathologic examination or diagnosis, or administering anesthesia, but would permit a physician to contract with nonprofit hospitals for not to exceed a year with financial provisions subject to review by an arbitration committee.

Rhode Island

Bill Introduced.—H. 855, to amend the law relating to health of school children, proposes that the services rendered to school children shall be rendered by duly licensed physicians or dentists.

Bill Passed.—H. 569 passed the house March 14. To amend the law relating to discrimination by any state department against certain professional groups of the healing arts, it proposes to include chiropractors within the group against which no discrimination is allowed.

South Carolina

Bill Passed.—S. 124 passed the house March 12. It proposes the creation of a South Carolina Hospital Commission to make a complete survey of the hospitals, health centers and other related facilities in the state and to file reports and recommendations concerning the same to the next session of the general assembly.

Virginia

Bill Enacted.—H. 289 has become chapter 164 of the Laws of 1946. It requires persons dealing in the handling and processing of food for human consumption to submit each six months a certificate from a physician duly licensed for that purpose by the state board of health, certifying that such person has been examined and found free from any contagious or infectious disease.

West Virginia

Bill Passed.—S. 3-X, passed the house March 22. To amend the law relating to hospital and medical service plan corporations, it proposes a new law for the organization and regulation of hospital service and medical service corporations. Among other features, it proposes the creation of a hospital and medical service advisory council to assist the insurance commissioner in the supervision of such corporations. "Medical service" would be defined as "such medical and surgical care, to be provided by duly licensed physicians, or such payment therefor, as may be specified in the contract made by the subscriber with the corporation."

Council on Medical Service and Public Relations

RADIO TRANSCRIPTIONS NOW READY

"The Public Comes First," a new series of six radio transcriptions prepared by the Council on Medical Service and Public Relations in cooperation with the Bureau of Health Education, is ready for distribution. These transcriptions, in which Harriet Hester, nationally known radio script writer, interviews members of the Council, deal with various phases of the medical care problem, urban and rural health, voluntary prepayment plans and the A. M. A. Constructive Program for Medical Care. These consist of the following fifteen minute transcriptions:

"What Constitutes Adequate Medical Care?" Dr. Roger I. Lee and Dr. Thomas A. McGoldrick.
"What Are Rural Medical Problems?" Dr. James R. McVay and Dr. W. R. Brooksher.
"The Costs of Illness," Dr. Louis H. Bauer.
"Hospital Insurance and How to Make Use of It," Dr. Alfred W. Adson and Mr. John R. Mannix.
"Prepaid Medical Service Plans," Dr. John H. Fitzgibbon and Mr. J. C. Ketchum.
"The Public Comes First," Dr. Herman L. Kretschmer and Dr. E. J. McCormick.

Notices of this service have been sent to various radio stations throughout the country. Proper committees of county medical societies are urged to contact their local radio stations and schedule these broadcasts. Stations are scheduling these on a sustaining (no fee) basis. These platters may be obtained free of charge by writing direct to the Bureau of Health Education or the Council office.

PREPAID MEDICAL CARE NEWS

Voluntary Prepayment Medical Care Plans—1945

The number of voluntary prepayment medical care plans sponsored or approved by medical societies is increasing so rapidly that any report becomes outdated before it is published. The most recent report, that of the Federal Security Agency, lists fifty-three such plans in operation as of June 1945. This is twenty more than was listed in the June 1944 reprint.

Twenty-five states now have one or more voluntary prepayment medical care plans in operation. These are Alabama, California, Colorado, Connecticut, Delaware, Iowa, Kansas, Louisiana, Massachusetts, Michigan, Missouri, Nebraska, New Jersey, New Hampshire, New York, North Carolina, Ohio, Oklahoma, Oregon, Pennsylvania, Texas, Virginia, Washington, West Virginia and Wisconsin.

The plans vary widely in some ways and yet, surprisingly enough, are quite similar in their basic characteristics. They vary widely in the areas covered. There are county plans, city plans, area plans and state plans. They vary considerably in the benefits provided to subscribers. Mostly they provide only in-hospital surgical and obstetric coverage, although benefits for x-ray and anesthesia are frequently included. A small number of plans include all services, medical and surgical, in or out of the hospital. A fairly recent benefit which is increasing in popularity is in-hospital medical care. This benefit does not start until after several days have elapsed and continues at a per diem rate for a period of from one to two and a half months.

The plans are similar in that all have a free choice of physician and that all are voluntary and with few exceptions include the entire family. The principle of allowing subscribers to continue the contract after leaving the group has been generally accepted. In such instances the premiums are paid at less frequent intervals, i. e. quarterly or semiannually. Waiting periods have become fairly well standardized and include from nine to twelve months for maternity cases and one year for tonsillectomies. A preexisting condition clause is found in some contracts.

The most popular type of plan is a combination service-indemnity plan in which subscribers earning less than a given amount may not be charged an additional fee by the doctors. When the subscribers' earnings are more than the stated income limit, the doctor is free to make an additional charge. There are, however, a number of exceptions to the combination type plan. On the one extreme are the Washington state plans (or bureaus, as they are termed), which offer a complete coverage with no income limits, and on the other extreme are the straight cash indemnity plans, such as Ohio Medical Indemnity, Inc.

The relationship with Blue Cross Hospital Plans has been the subject of much discussion pro and con. The tendency in most areas is to work with Blue Cross, particularly in administration. Thirty-one of the fifty-three plans are coordinated with Blue Cross hospital plans. Eight of these are operated under single boards of trustees, and the hospital service corporation offers both contracts. In other words, there is really no medical plan but rather a hospital plan offering medical coverage.

In the remaining twenty-three plans the medical and hospital groups have separate corporations each controlled by their respective professions. Here the hospital plan participates in or handles entirely the administration, usually on a contract basis.

The year 1945 has given a tremendous impetus to the voluntary prepayment medical care plan movement. Fifteen new plans were started, with practically no two alike in any but the basic characteristics. Other plans are in the making and will be started in 1946.

A year ago a general pattern for plans seemed to have been set. However, the fifteen new plans formed in 1945 have brought forth a number of new ideas with which to experiment, not experiment as to the actuarial soundness of given premiums and benefits but experiment as to underwriting, as to control and as to administration features. The big problem now is to devise a means for determining the success of the various experiments, get cooperation in gathering information from the plans and provide some central unit or authority to correlate the program in general.

Indiana Adopts Medical Insurance Plan

After three years of study and discussion by the Indiana State Medical Association, the house of delegates has authorized the creation of a nonprofit mutual indemnity insurance company.

The company will bear the name "Mutual Medical Insurance, Inc." and will be organized under the Indiana statutes. It is planned to offer a limited medical and a surgical coverage on a group basis.

The plan will be financed by contributions from physicians and other interested groups. The required paid in capital is $65,000; of this sum $25,000 must be deposited with the state department of insurance. The remainder will be available for organizing and operation expenses.

The board of directors consists of the following physicians:

I. C. Barclay, Evansville
James H. Crowder, Sullivan
A. P. Hauss, New Albany
C. F. Overpeck, Greensburg
A. M. Mitchell, Terre Haute
W. U. Kennedy, New Castle
Cyrus J. Clark, Indianapolis
E. H. Clauser, Muncie
J. E. Ferrell, Fortville
Wemple Dodds, Crawfordsville
William H. Howard, Hammond
C. S. Black, Warren
A. Jerome Sparks, Fort Wayne
Alfred Ellison, South Bend
Walter L. Portteus, Franklin
F. S. Crockett, Lafayette
M. R. Lohman, Fort Wayne
F. T. Romberger, Lafayette

Washington Letter

(From a Special Correspondent)

March 25, 1946.

Doctors Named to Veterans Administration Staff

Two assistant administrators and five specialists have bee appointed to the Veterans Administration medical staff, Dr. Pa R. Hawley, medical director, announced. Dr. J. C. Harding o Washington will be assistant medical director for auxiliary services, and Dr. M. M. Fowler of Chevy Chase, Md., will b assistant medical director for dental services. Five physician named as part time chiefs of sections in the professional service division are Brig. Gen. James S. Simmons, who directs th Army's preventive medicine program, tropical medicine; Dr Albert M. Snell of the Mayo Clinic, gastroenterology; Dr Charles C. Wolferth, University of Pennsylvania Hospital cardiology; Dr. Harry L. Alexander, Washington University School of Medicine, allergy; Dr. James H. Maxwell, University of Michigan Medical School, otolaryngology. The Veterans Administration has ordered an acceleration in hospital construction to relieve a current shortage of beds in veterans' hospitals The agency has called for 1,500 rehabilitation specialists to aid in a medical program of education and shop training for veterans' hospitals. Dr. Donald A. Covalt, assistant director for medical rehabilitation, hopes to provide training for 5,000 persons in reconditioning and convalescent programs.

Approval of Mental Health Bill Asked by Senator Pepper

Senator Pepper, Democrat of Florida, is pushing for a favorable report by the Senate Education and Labor Committee on legislation to inaugurate a nationwide attack on mental disease problems. He plans to urge larger appropriations than those advocated by the House, $4,500,000 for a Mental Health Institute at Bethesda and $10,000,000 for research work and aid to the state. Senator Pepper favors a $10,000,000 outlay for the center, since Surgeon General Parran revealed that the $4,500,000 estimate was based on prewar costs. Congressman Priest, Democrat of Tennessee, introduced the bill after it was reported that half of all United States hospital beds are occupied by mental patients.

Senator Calls for Five Year Health Program

Senator Murray, Democrat of Montana and chairman of the Senate Education and Labor Committee, advocated a five year health program for America, stating that "the time has come to stake out long-range health goals for America's future." He announced that he had asked the American Medical Association and the American Dental Association and some 180 other organized groups in the health field for opinions of what should be "specific health goals" for the next five years. Senator Murray will open hearings April 2 on proposed legislation for national health insurance, which contemplates prepayment of medical and hospital costs.

Food Shortage Expected to Last Another Year

A Department of Agriculture official reports that the food shortage "will be with us into the 1947 harvest," confirming claims of retiring director general Herbert Lehman of UNRRA. The Agriculture spokesman denied that food officials had taken the stand that food supply problems would end with the beginning of the 1946 harvest. Asked at his press conference about Mr. Lehman's suggestion that the nation return to wartime food rationing, President Truman said he would not object if this should prove necessary, but he hoped that it could be avoided

Warning by Secretary of State that Draft Must Be Extended

Secretary of State James F. Byrnes told the Senate Military Affairs Committee that the security and welfare of the country will be at stake if the Draft Act, scheduled to expire on May 15, is not renewed. Warnings of dangers in depletion of the armed forces were also given by Army Chief of Staff Eisenhower and War Secretary Patterson.

Amputees Assured That They Will Get Cars

Assurances were given from two quarters that amputees would be provided with automobiles, as requested by a group of them here recently. Congressman Rogers, Republican of Massachusetts, said that she will sponsor legislation to buy cars for amputees if the Veterans Administration refuses to provide them. Miss Dorothy Frooks, New York lawyer, in talking with a six man war amputee car committee at Forest Glen Sanitarium of Walter Reed Hospital, said that Public Law 16 provides that any disabled veteran is entitled to equipment for "employability." Col. Wallace H. Graham, personal physician to President Truman, promised to communicate Miss Frooks's interpretation of the law to the President, who has been concerned over this phase of amputee problems.

Plan to Reduce Fatal Accidents

The Federal Interdepartmental Safety Council submitted to President Truman a plan to extend safety measures to all federal departments and agencies in the hope of cutting down accidents which cost 2,852 lives in five and a half years. The plan was approved at a meeting of 100 agency representatives. It provides for a minimum expenditure of $3 per employee annually to set up safety activities.

Cattle Vaccine to Improve Food Supply

Development of a vaccine to protect cattle against rinderpest, or cattle plague, reported by a United States-Canadian commission, is expected to improve the world food supply. Although the disease does not prevail here, it is virulent in the Orient, and a million doses of the vaccine have been turned over to the United Nations Relief and Rehabilitation Administration to be shipped to China.

Possibility of Preventing Outbreak of Malaria

Dr. Daniel L. Seckinger, assistant medical officer of the District of Columbia, states that, despite the presence in Washington of returned soldiers who carry the malaria parasite, an outbreak of malaria can be avoided by proper precautions. "There may be some cases this summer, but there should be no epidemic," he said.

Retirement of Lehman from UNRRA Because of Ill Health

Herbert T. Lehman, former governor of New York, has had to resign as director of the United Nations Relief and Rehabilitation Administration because of ill health. He has worked hard and untiringly to make a success of the world relief organization.

Truman Names April "Cancer Control Month"

President Truman has proclaimed April "Cancer Control Month." Calling on the American people for a concerted effort to eradicate cancer, he said that cancer took a toll of 170,000 lives last year and that "a large percentage of deaths from cancer can be prevented if the disease is discovered and treated in its early stages."

End of Army Specialized Training Program at Georgetown

Graduation exercises at Georgetown University School of Medicine signalized the formal closing there of the Army Specialized Training Program. Georgetown set up a model system that was adopted by the Army throughout the country.

Praise for Government Research Work

Dr. Cora Dubois of the State Department's Office of Research and Intelligence told the Anthropological Society of Washington that "our government pursues research on a scale and of a quality unsuspected by many of us before we came down here."

Speedy Passage Asked for Washington Slum Clearance Bill

John Ihlder, executive director of the National Capital Housing Authority, has asked for speedy House passage of a $20,000,000 slum clearance bill for the nation's capital.

Zoning Laws May Be Lifted to Aid Doctors

Washington doctors returning from military service who have been unable to find office space may get relief through a proposed amendment to strict District of Columbia zoning regulations to permit doctors and dentists to open offices in residential areas.

Coming Medical Meetings

Aero Medical Association, Chicago, April 7-9. Dr. David S. Brachman, 1016 Dime Building, Detroit 26, Secretary.

Alabama, Medical Association of the State of, Birmingham, April 16-18. Dr. Douglas L. Cannon, 519 Dexter Ave., Montgomery 4, Secretary.

American Association of Anatomists, Cleveland, April 4-6. Dr. Eliot R. Clark, University of Pennsylvania School of Medicine, Philadelphia 4, Secretary.

American College of Physicians, Philadelphia, May 13-17. Mr. E. R. Loveland, 4200 Pine St., Philadelphia 4, Executive Secretary.

American Pediatric Society, Skytop, Pa., May 1-3. Dr. Hugh McCulloch, 325 N. Euclid Ave., St. Louis 8, Secretary.

American Gastro-Enterological Association, Atlantic City, May 24-25. Dr. J. Arnold Bargen, 102 Second Ave., S. W., Rochester, Minn., Secretary.

American Society for Research in Psychosomatic Problems, New York, May 11-12. Dr. Edwin G. Zabriskie, 714 Madison Ave., New York 21, Secretary.

American Surgical Association, Hot Springs, Va., April 2-4. Dr. Warfield M. Firor, Johns Hopkins Hospital, Baltimore 5, Secretary.

Arizona State Medical Association, Phoenix, May 2-3. Dr. Frank J. Milloy, 112 N. Central Ave., Phoenix, Secretary.

Arkansas Medical Society, Little Rock, April 14-15. Dr. W. R. Brooksher, 602 Garrison Ave., Fort Smith, Secretary.

California Medical Association, Los Angeles, May 7-10. Dr. George H. Kress, 450 Sutter St., San Francisco 8, Secretary.

Central States Dermatological Society, Detroit, April 27. Dr. Clarence E. Reyner, Henry Ford Hospital, Detroit, Secretary.

Connecticut State Medical Society, Hartford, May 1-3. Dr. Creighton Barker, 258 Church St., New Haven 10, Secretary.

Florida Medical Association, Jacksonville, April 22-24. Dr. Robert B. McIver, P. O. Box 1018, Jacksonville, Secretary.

Georgia, Medical Association of, Macon, May 7-10. Dr. Edgar D. Shanks, 478 Peachtree St., N.E., Atlanta, Secretary.

Illinois State Medical Society, Chicago, May 14-16. Dr. Harold M. Camp, 224 S. Main St., Monmouth, Secretary.

Iowa State Medical Society, Des Moines, April 17-19. Dr. John C. Parsons, 406 Sixth Ave., Des Moines 9, Secretary.

Kansas Medical Society, Wichita, April 22-25. Dr. F. R. Croson, 112 W. Sixth St., Topeka, Secretary.

Louisiana State Medical Society, Alexandria, May 6-8. Dr. P. T. Talbot, 1430 Tulane Ave., New Orleans 13, Secretary.

Maryland, Medical and Chirurgical Faculty of, Baltimore, April 23-24. Dr. W. Houston Toulson, 1211 Cathedral St., Baltimore 29, Secretary.

Massachusetts Medical Society, Boston, May 21-23. Dr. Michael A. Tighe, 8 Fenway, Boston, Secretary.

Minnesota State Medical Association, St. Paul, May 20-22. Dr. B. B. Souster, Lowry Medical Arts Bldg., St. Paul 2, Secretary.

Mississippi State Medical Association, Jackson, May 14-15. Dr. T. M. Dye, Box 295, Clarksdale, Secretary.

Nebraska State Medical Association, Lincoln, May 6-9. Dr. R. B. Adams, 416 Federal Securities Bldg., Lincoln 8, Secretary.

New Hampshire Medical Society, Manchester, May 14. Dr. C. R. Metcalf, 5 S. State St., Concord, Secretary.

New Jersey, Medical Society of, Atlantic City, May 21-23. Dr. Alfred Stahl, 55 Lincoln Park, Newark, Secretary.

New Orleans Graduate Medical Assembly, New Orleans, April 1-4. Dr. Joseph S. D'Antoni, 1430 Tulane Ave., New Orleans 13, Secretary.

New York, Medical Society of the State of, New York, April 29-May 3. Dr. Walter P. Anderton, 292 Madison Ave., New York 17, Secretary.

North Carolina, Medical Society of the State of, Pinehurst, May 1-3. Dr. Roscoe D. McMillan, P. O. Box 232, Red Springs, Secretary.

Northern Tri-State Medical Association, South Bend, Ind., April 9. Dr. John L. Stifel, 232 Michigan St., Toledo 2, Secretary.

Ohio State Medical Association, Columbus, May 7-9. Mr. Charles S. Nelson, 79 E. State St., Columbus, Executive Secretary.

Postgraduate Institute of the Philadelphia County Medical Society, Philadelphia, April 9-12. Dr. George P. Muller, 301 S. 21st St., Philadelphia, Director.

Rhode Island Medical Society, Providence, May 15-16. Dr. William P. Buffum, 122 Waterman St., Providence 6, Secretary.

South Carolina Medical Association, Greenville, April 30-May 2. Dr. Julian P. Price, 105 W. Cheves St., Florence, Secretary.

Tennessee State Medical Association, Knoxville, April 9-11. Dr. W. M. Hardy, 706 Church Street, Nashville, Secretary.

Texas, State Medical Association of, Galveston, May 6-9. Dr. Holman Taylor, 1404 W. El Paso St., Fort Worth 3, Secretary.

West Virginia Medical Association, Huntington, May 13-15. Mr. Charles Lively, P. O. Box 1031, Charleston 24, Executive Secretary.

Southwest Allergy Forum, Houston, Texas, April 8-9. Dr. Albert H. Braden, 1704 Crawford St., Houston, Secretary.

Society of American Bacteriologists, Detroit, May 21-24. Dr. Leland W. Parr, 1335 H St., N. W., Washington 5, D. C., Secretary.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH)

ALABAMA

State Medical Meeting.—The Medical Association of the State of Alabama will hold its 1946 session at the Thomas Jefferson Hotel, Birmingham, April 16-18 under the presidency of Dr Walter F Scott, Birmingham, and with the Jefferson County Medical Society acting as host Among the speakers will be

Dr Edgar Burns New Orleans, Clinical Importance of Congenital Anomalies of the Urinary Tract
Dr J Brown Farrior, New Orleans, A Critical Analysis of the Fenestration Operation
Major Frederic T Becker, M C Memphis, Tenn , Cutaneous Eruptions Frequently Seen in Eye, Ear, Nose and Throat Practice
Dr Lawson Thornton, Atlanta, Ga , Injuries to the Hip
Col James B Brown, M C , New Orleans, Military Plastic Surgery
Dr Champ Lyons, New Orleans, Chronic Shock—Its Diagnosis and Treatment
Edwin F Stegen, Chicago, Showdown on Political Medicine

There will be many Alabama physicians on the program On Tuesday a special ceremony will be held in the auditorium of Hillman Hospital to present to the Medical College of Alabama portraits of Chauncey Sparks, governor of Alabama, and Dr William D Partlow, Tuscaloosa, chairman of the "Four Year Medical School" of the state medical association, in appreciation of their services toward procuring the Medical College of Alabama On Wednesday Dr Alton Ochsner, New Orleans, will deliver the Jerome Cochran Lecture on "The Significance of Incidental Observations in the Progress of Medicine "

ARKANSAS

Physician Honored.—Dr Merrieman L Norwood, Lockesburg, was given a dinner by the Arkansas Medical Society to honor his many years' service to the profession Dr Norwood, who is a senior in the list of living past presidents of the state society, was presented with a watch as a memento of the occasion

State Medical Meeting.—The seventieth session of the Arkansas Medical Society will be held at the Hotel Marion, Little Rock, April 15-17, under the presidency of Dr Davis W Goldstein, Fort Smith, who will speak on "The Physician's Responsibility in Venereal Disease Control " Among the out of state speakers will be

Dr Howard R Mahorner, New Orleans Surgical Experience with Vascular Diseases of the Lower Extremities
Dr Walter C Alvarez Rochester Minn What is Wrong with the Dyspeptic Whose Findings are all Negative
Dr Lee De Cady St Louis, The Development of Prepaid Medical Service in the United States
Dr Herbert R Edwards, New York, Trends in Tuberculosis Control Procedures
Dr Wiley R Buffington, New Orleans, Detached Retina
Mr George B Larson, Chicago, Lay Cancer Education and the Physician
Dr Roland M Klemme, St Louis, Surgical Treatment of Parkinson's Disease
Dr Hardy A Kemp Detroit, The Michigan State Medical Society's Plan for Providing Practice Arrangements with Beneficiaries of the Veterans Administration

CALIFORNIA

Carl Schmidt Dies.—Carl L A Schmidt, Ph D , professor of biochemistry and chairman of the division, University of California Medical School, Berkeley, from 1924 to 1944, when he retired, died February 23, aged 60

Borden Award Given to Student.—Robert O Scow, Avenal, has been presented the annual Borden undergraduate research award of $500 by unanimous choice of the research committee of the University of California Medical School The award, financed by the Borden Foundation, is made annually to a graduating senior for research which is deemed most meritorious (THE JOURNAL, Dec 22, 1945, p 1218) Dr Scow led or participated in research which has resulted in the publication of ten scientific papers The research committee commended Scow for remarkable ingenuity in research

Applications for Licensure for 1945—During the year 1945 there were 1,926 applications filed for the various types of certificates issued by the California State Board of Medical Examiners, of this number 1,704 were for physicians and surgeons certificates The number of applications filed for written examination showed a slight increase over the previous year while the number of reciprocity applicants who based their applications on a license issued by another state, national board credentials or commissions in the United States Army, Navy or Public Health Service showed an increase of 528, or nearly twice the number filed in 1944 The number of certificates issued in 1945 of all types totaled 1,419, of this number 1 208 were physicians and surgeons certificates, 599 were issued by reciprocity to applicants who based their applications on a license issued by some other state, 98 were issued on national board credentials and 11 were issued on government credentials On Dec 31, 1945 there were 641 applications of all classes on file and awaiting final disposition in 1946

CONNECTICUT

State Medical Meeting—The Connecticut State Medical Society will hold it 154th meeting in Hartford, May 1-3, under the presidency of Dr Joseph H Howard, Bridgeport Among the speakers will be

Dr Perrin H Long Baltimore, Medical Progress and Medical Education During the War
Col James C Harding, M C , Washington, The Place of Civilian Physicians in the Medical Care of Veterans
Dr Dean A Clark, New York, Voluntary Health Insurance Plans
Dr James A Shannon, New York, Malaria
Dr Chester S Keefer Boston, The Clinical Use of Penicillin and Streptomycin
Dr Oliver Cope, Boston, Thyroid Lumps
Dr Isidor S Ravdin, Philadelphia Protein Deficiencies
Dr William Dock, Brooklyn, The Value and Hazards of Complete Bed Rest
Dr J Burns Amberson Jr , New York Chronic Nontuberculous Pulmonary Disease Clinical Principles Useful in Diagnosis and Treatment

Features of the meeting will include a symposium on the hospital as a public service unit with Dr Louis P Hastings Hartford, presiding, and a symposium on diseases of the blood with Dr Harold M Marvin, New Haven, presiding and the following speakers

Dr William B Castle, Boston, Physiology of Blood Diseases, with Particular Reference to the Mechanism of Therapy
Dr Paul Reznikoff New York, Practical Aspects of the Treatment of Hematologic Conditions
Dr Wyman Richardson Boston The Selection, Interpretation and Limitations of Laboratory Procedures in Hematology

INDIANA

Advisory Health Council—The Indiana Advisory Health Council, comprising forty five members appointed by the governor, was created by the 1945 legislature The council is representative of various organizations throughout the state At its first meeting in Indianapolis Dr Harry P Ross, Richmond was chosen chairman, Howard H Sweetman, Indianapolis, vice chairman and Mrs George D French, Indianapolis, secretary

Dr. Damon In Charge of State Laboratories—Samuel R Damon, Ph D , director of the bureau of laboratories of the Alabama State Department of Health, has been appointed head of the laboratories of the Indiana State Board of Health to fill the vacancy created when Dr Clyde G Culbertson, Indianapolis resigned to take a position with Eli Lilly and Company (THE JOURNAL, March 9, p 657) Dr Damon received his Ph D at Brown University, Providence, R I He once was a member of the Rhode Island State Department of Health and also of the Johns Hopkins University School of Hygiene and Public Health Baltimore

IOWA

State Medical Meeting.—The ninety fifth session of the Iowa State Medical Society will be held at the Hotel Fort Des Moines, April 18-19, under the pres dency of Dr Ransom D Bernard, Clarion Among the speakers will be

Dr William S Middleton, Madison, Wis , Infectious Hepatitis
Dr Henry L Williams, Rochester, Minn Diagnosis, Cause and Treatment of Endolymphatic Hydrops (Meniere's Disease)
Dr Henry H Searls, San Francisco War Wounds of the Abdomen
Dr William A O'Brien Minneapolis Recent Developments in H pital Organizations and Medical Practice That May Affect the Future
Dr Frank L Feierabend, Kansas City, Mo , The Doctor s Role in the Postwar World
Major Gen Paul R Hawley, M C , Veterans Administration Prog

The program will also include a series of section meetings to be addressed, among others, by Drs Oscar T. Clagett, Rochester, on "Lung Resection in Pulmonary Tuberculosis" and Sumner Cohen, Oak Terrace, Minn , 'Tracheobronchial Tuberculo " Other groups meeting will be the Iowa Pathological Society, the State Society of Iowa Medical Women, Iowa Medical Service and the Woman's Auxiliary of the state medical society The Iowa Anesthesiological Association will be addressed by Dr Ralph T Knight, Minneapolis, on "Economics of Anesthesiology "

MAINE

Personal.—Dr. James W. Loughlin, Newcastle, for many years district health officer for District 111, comprising Kennebec, Knox, Lincoln, Sagadahoc and Waldo counties, has retired.——Dr. Delmer A. Craig has resigned as medical director of the Eastern Maine General Hospital to become associated with Charles F. Neergaard, consultant in hospital planning, organization and management, New York.

MARYLAND

Hospital Survey.—Dr. Walter D. Wise, professor of surgery, University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, has been appointed chairman of a new hospital survey committee named by the committee on medical care of the Maryland State Planning Commission.

Health Officer for Forty-Four Years.—Dr. Isaac N. King, deputy state and health officer of Calvert County, resigned February 1, ending some forty-four years' service with the state department of health. Dr. King had been health officer of Calvert County since 1902 and deputy state health officer since 1924. Dr. King, who is president of the Medical and Chirurgical Faculty of Maryland, has been succeeded by Dr. Hugh W. Ward, Owings, as deputy and health officer of Calvert County. Other changes in the department include the reinstatement of Dr. Edward Davens, Baltimore, as chief of the bureau of child hygiene, state department of health, and the reinstatement of Dr. Theodore R. Shrop as deputy state and health officer of Howard County, according to the *Maryland Health Bulletin.*

MINNESOTA

The Judd Lecture.—The thirteenth E. Starr Judd Lecture will be given by Dr. Samuel C. Harvey, William H. Carmalt professor of surgery at Yale University School of Medicine, New Haven, April 15, in the Medical Science Amphitheater. His subject will be "The Healing of the Wound." The late E. Starr Judd, an alumnus of the Medical School of the University of Minnesota, established this annual lectureship in surgery a few years before his death.

MONTANA

Miscellaneous Activities.—Dr. Eugene Hildebrand Jr., formerly of Chicago, is now pathologist and director of laboratories of the Great Falls Clinic, the *Journal Lancet* reports.——The Montana Physicians' Service has been organized on a nonprofit basis to provide the people of Montana with medical care on a budget basis, with Dr. Maurice A. Shillington, Glendive, as president. The service will work in cooperation with the Montana Blue Cross hospitalization organization. The service was set up with the assistance of Dr. Chester L. Cooley, president of the San Francisco County Medical Society and board secretary of the California Physicians' Service. The new group will cooperate with the California service in the veterans' medical care program.

NEW JERSEY

Fredrick Yonkman Named Research Director.—Dr. Fredrick F. Yonkman, chief pharmacist of Ciba Pharmaceutical Products, Inc., Summit, has been appointed director of research for the organization. Dr. Yonkman was formerly professor of pharmacology and therapeutics at Wayne University College of Medicine, Detroit.

NEW YORK

Nutrition Council Urged.—Creation of an adequately financed state nutrition council to coordinate the work of all state departments in the field of nutrition and encourage research and educate the public on the subject was asked March 1 in a report of the joint legislation committee on nutrition, according to the New York *Times.*

New Health Officer in Rochester.—Dr. Robert S. Westphal, Batavia, has resigned as district health officer to become deputy health officer of Rochester, according to newspaper reports. Dr. Westphal will succeed Dr. Burtis B. Breese, who resigned as city health officer to enter private practice. The new appointment will be effective about April 15.

Allergy Group Formed.—On February 1 a group of sixteen physicians met at the Rochester Academy of Medicine to form what will probably be known as the "Section on Allergy of the Rochester Academy of Medicine." Dr. Stearns S. Bullen was elected chairman of the section and Dr. John M. Parker secretary-treasurer, both of Rochester. At a meeting Henry W. Scherp, Ph.D., Rochester, spoke on "Fundamental Immunological Conceptions in Allergy."

James Wilson Honored.—Dr. James R. Wilson, who left his medical activities in Syracuse to join the Americal Medical Association as Secretary of the Council on Foods and Nutrition, was given a farewell dinner February 15 by the Syracuse Children's Bureau and friends and associates at Syracuse University College of Medicine, where he was associate professor of medicine. In addition to many gifts, Dr. Wilson received a typewriter and a scroll signed, among others, by Dr. Herman G. Weiskotten, dean of the medical school; Dr. Leon E. Sutton, Syracuse, and Dr. John A. Root, Clyde, who is succeeding Dr. Wilson as medical adviser at the Children's Bureau.

"Screening" Examinations for Cerebral Palsy Patients.—On March 11 preliminary "screening" examinations were to begin in Strong Memorial Hospital, Rochester, the first step in the development of a Cerebral Palsy Clinic to be formed by the Strong Memorial Hospital and the Rochester Municipal Hospital (The Journal, February 2, p. 296). In connection with the project a Cerebral Palsy Association was established by a group of parents. Press reports indicate that the formal clinic has not been organized for treatment but will be started later "in a modest way." Under present plans, successive Monday afternoons will be devoted to preliminary examinations of child sufferers for classification and determination of the severity of the disease. The association, through its secretary, Mrs. Herbert C. Soule Jr., Rochester, is arranging appointments for 5 children each Monday, and these schedules will be used at the hospital. After the preliminary examinations have been made, the clinic will be set up in Municipal Hospital, where the permanent treatment center will be located. The treatment department will accommodate 10 hospitalized patients in addition to the ambulatory cases. Physicians from the pediatric, orthopedic, psychiatric and neurologic divisions of Strong Hospital will participate. Under the clinic setup, it is planned, parents will be given instructions for home treatment to follow the specialized therapy at the clinic. The clinic will be supported in part by the state health department and by such special groups as the Elks who have contributed funds. Space for the clinic will be donated by Municipal Hospital.

New York City

Officers of Spanish Speaking Group.—Dr. Jacob M. Gershberg continues as president of the International and Spanish Speaking Association of Physicians, Dentists and Pharmacists for 1946. Among other officers are Dr. Milton B. Plotz, Brooklyn, executive secretary; Dr. William B. McDonough, general secretary, and Dr. Frederick S. Aron, treasurer.

Forum on the Hippocratic Oath.—Dr. Carl A. L. Binger gave the first of a series of forum lectures sponsored by the division of social philosophy of Cooper Union February 5. His topic was "The Doctor's Job." The forum, under the general title of "The Hippocratic Oath," is being given on Tuesday evenings through April 23. Other speakers include:

Dr. Louis H. Schwartz, February 26, The Eye as an Index of Health.
Dr. Ernst P. Boas, March 5, Middle Age: The Test of Modern Medicine.
Dr. Walter Modell, March 12, The New Drugs.
Dr. Norman H. Jolliffe, March 26, Nutrition Comes to the Aid of Medicine.
Dr. Thomas A. C. Rennie, April 2, Mental Illness.
Dr. Stewart Wolf Jr., April 9, Psychosomatic Medicine.
Dr. Leopold Brahdy, April 16, Industrial Medicine.
April 23, not announced.

Regents Rule on Medical and Dental Schools Merger.—The state board of regents ruled February 15 that the merger of the medical and dental schools of Columbia University was "a matter of internal concern for the university itself," in which the board had interest only if courses should fall below prescribed standards, according to the New York *Times.* The case was closed on the recommendation of the board's committee on administration, which conferred with officers of the state dental society, who had requested an investigation of circumstances surrounding the merger of the College of Dental and Oral Surgery and the College of Physicians and Surgeons. In submitting its request the society had cited the fact that the Columbia Dental School had been removed by the New Jersey Board of Registration and Examination from its list of approved schools. The merger of the two schools was reported in The Journal, March 10, 1945, page 606.

Eye and Ear Infirmary Joins Proposed Medical Center.—The New York Eye and Ear Infirmary, said to be the oldest hospital of its kind in North America, voted February 27 to join the New York University-Bellevue Medical Center plan for the Bellevue area (The Journal, Dec. 29, 1945, p. 1277). The infirmary will retain its identity under the new arrangement but will occupy a section of the new University Hospital when completed. The infirmary is now housed in a half century old brownstone building at Second Avenue and Thirteenth Street.

The New York Eye and Ear Infirmary was founded in 1820 and is the third oldest hospital of any kind in the city. The founders, Edward Dilafield and John Kearny Rodgers, were inspired by the work of the Royal London Ophthalmic Hospital while studying abroad. On their return they organized the infirmary "to contribute toward the relief of the poor who by a diseased state of one of the most important organs in the human body are deprived of the means of gaining a livelihood."

Grant for Tropical Disease.—The Marcelle Fleischmann Foundation has made a grant of $20,000 a year for a ten year period to the department of public health and preventive medicine of Cornell University Medical College for the study of tropical disease. The specified purpose of the gift is to promote the study of immunologic and allergic manifestations of exotic diseases and to provide for a better understanding of their prevention and treatment. The investigations at Cornell will be under the direction of Morton C. Kahn, Sc.D., associate professor of public health and preventive medicine at Cornell. The Marcelle Fleischmann Foundation is a philanthropy that has been founded recently by Mr. E. M. Fleischmann, Baltimore, in memory of his late wife. This gift was announced in a convocation in the auditorium of Cornell, February 8. A portrait of Marcelle Fleischmann was unveiled at these exercises, and the researches to be conducted under the grant were dedicated to her memory. Mr. Fleischmann made an address in which he presented the grant and indicated the purposes for which it is given.

NORTH CAROLINA

New Industrial Head.—Dr. Otto J. Swisher Jr. has been appointed director of the division of industrial hygiene of the North Carolina State Department of Health, succeeding Dr. Charles B. Davis Jr., Wilmington, resigned. Dr. Swisher, prior to his entry in military service, from which he was recently released, served as director of the division of industrial hygiene of the West Virginia State Board of Health and as health officer of Covington, Tenn.

W. T. Sanger Named Head of Hospital Survey.—William T. Sanger, LL.D., Richmond, Va., president of the Medical College of Virginia, was recently elected president of a special national committee chosen by the North Carolina Medical Care Commission to make a survey of hospital facilities to determine the best location for the proposed expanded medical school and hospital of the University of North Carolina. Other members of the committee include:

Graham Davis, Battle Creek, Mich., hospital director of the Kellogg Foundation.

Dr. John A. Ferrell, New York, medical director of the John and Mary Markle Foundation.

Dr. Hugh R. Leavell, New York, assistant director for medical sciences, Rockefeller Foundation.

Dr. Samuel Proger, Boston, Joseph H. Pratt Diagnostic Hospital.

Dr. Eugene L. Bishop, Chattanooga, Tenn., director of health for the Tennessee Valley Authority.

Dr. Victor Johnson, Chicago, Secretary, Council on Medical Education and Hospitals of the American Medical Association.

OHIO

Strauss Memorial Fund.—Announcement has been made of the creation at Mount Sinai Hospital, Cleveland, of a fund in memory of Dr. Abraham Strauss, late chief of staff in surgery. The fund will be used to provide fellowships for advanced surgical training, a cause which was close to the heart of Dr. Strauss.

Medical Officers of World War II.—The Association of Medical Officers of World War II, incorporated by physicians of Toledo, now has eighty-eight members, all of whom are affiliated with the Academy of Medicine of Toledo and Lucas County. Officers include Dr. Aaron D. Vogelsang, president; Dr. Edouard E. Lyon, vice president; Dr. Richard Hotz, secretary, and Dr. Hazen L. Hauman, treasurer, all of Toledo. It is hoped to make the membership national.

Community Health Festivals.—The Cleveland Health Council, the Anti-Tuberculosis League and the Goodrich Social Settlement House sponsored the second in a series of community health festivals, February 26-28. Twenty organizations displayed health exhibits at a health fair in addition to miscellaneous entertainment. Afternoon sessions were devoted to health in the home, health in the schools and health in the community. Speakers in the evening included Dr. Henry C. Schumacher, Cleveland, Healthy Minds; Dr. Joseph B. Stocklen, Cleveland, How to Keep Well, and Dr. Charles F. McKhann, Cleveland, Health in Growing Children.

War Story Contest.—Members of the Academy of Medicine of Cleveland who served in any branch of the armed services during World War II are invited to submit compositions for a literary contest. Material may relate any experience or event of the author's service. The prizes which are offered by the Bulletin of the academy include a first prize of $50, second prize $15, third prize $10 and honorable mention comprising five prizes of $5. Manuscripts must be in English, typewritten, double spaced and ranging from 750 to 1,000 words. All entries must be submitted to the editor of the Bulletin by May 15. The editorial staff of the Bulletin will be the judges.

PENNSYLVANIA

Charles Crampton Named Deputy Secretary of Health.—Dr. Charles H. Crampton, Harrisburg, has been appointed by Gov. Edward Martin as deputy secretary of health. His appointment brings to three the number of deputy secretaries, the others being Carl C. Tinstman, administrative deputy, and Dr. J. M. Campbell, Harrisburg, medical deputy.

Allen Cowley Wins Seibert Award.—Dr. Allen W. Cowley, Harrisburg, was recently presented with the Seibert Memorial Award, given biennially by the Harrisburg Academy of Medicine. The $500 award is a memorial to the late Dr. William Henry Seibert, who served as the first president of the academy and is made to a physician under 45 who has "preeminently distinguished himself in his profession and whose life as a citizen and scholar has been broad, unselfish and exemplary."

Personal.—Dr. Irene F. Laub, Easton, was elected president of the Northampton County Medical Society recently, the first woman to hold this position in the society.——Dr. Harold K. Hogg, Lancaster, has been named executive secretary of the Lancaster Board of Health, succeeding Dr. Joseph Appleyard, resigned.——Dr. Charles H. Witmer, Lancaster, a member of the St. Joseph's Hospital staff since 1912, has been appointed medical director of the hospital to succeed Dr. John L. Atlee, Lancaster, who resigned after eight years in the position.

Ophthalmologic Meeting.—The Pennsylvania Academy of Ophthalmology and Otolaryngology will hold its annual meeting at the Merion Golf Club, outside of Philadelphia, April 24-25. Among the speakers will be:

Dr. James N. Greear Jr., Washington, D. C., Some Interesting Phases of War Ophthalmology.

Dr. Chevalier L. Jackson, Philadelphia, Pan American Otolaryngology.

Dr. Walter S. Atkinson, Watertown, N. Y., Anesthesia in Ophthalmology.

Dr. Walter I. Lillie, Philadelphia, Retinal Arteriolar Sclerosis.

Dr. Robin C. Buerki, Philadelphia, Contemporary Medical Problems.

Capt. Fred Harbert, Philadelphia, Symposium on the Hard of Hearing.

Philadelphia

Health Institute.—The Woman's Auxiliary of the Philadelphia County Medical Society will hold its sixteenth health institute in the auditorium of the society on April 9. The theme of the meeting will be "Health in the Postwar Era." Among the speakers will be:

Dr. Lewis C. Scheffey, president of the county society.

Dr. Margaret D. Craighill, Experiences in World War II.

Dr. Oliver Spurgeon English, The Role of Psychiatry in a Permanent Peace.

Dr. William Harvey Perkins, The Future of Public Health.

Dr. Edward L. Bortz, The Atomic Bomb.

Dr. George Morris Piersol, The Future of Physical Medicine.

Dr. William G. Leaman Jr., Rheumatic Fever.

TEXAS

Allergy Forum.—The Southwest Allergy Forum will be held at the Rice Hotel, Houston, April 7-9. Among the speakers will be:

Dr. Paul D. Fleming, Houston, The Life Cycle of the Allergic Individual.

Dr. Frank R. Rugeley, Wharton, Allergic Causes of Pruritus Ani.

Dr. Theron G. Randolph, Chicago, Practical Aspects of Food Allergy.

Dr. Philip M. McNeill, Oklahoma City, Classification of Headaches, with Particular Reference to Management.

Dr. Paul T. Petit, Beaumont, Use of Sulfonamide Drugs in Prevention and Treatment of Infective Episodes in Bronchial Asthma.

Dr. Jesse B. Shelmire, Dallas, Contact Dermatitis.

Dr. Bayard T. Horton, Rochester, Minn., Histamine and Antihistamine Agents: Their Use in Clinical Medicine.

Dr. H. Whitney Boggs, Shreveport, La., Conditions Producing Dyspnea Which Have Been Diagnosed as Asthma.

In addition there will be round table discussions, and the guest speaker at the dinner will be Chauncey D. Leake, Ph.D., Dallas, on "The Pharmacology of Drugs Used in the Treatment of Allergy."

WISCONSIN

Gundersen Foundation to Award Scholarship.—The La Crosse Board of Education accepted the $300 annual scholarship award established by the Dr. Adolph Gundersen Memorial Foundation. The foundation was organized on Dec. 20, 1944 to enable members of the medical profession to further research and study. It was named in honor of the late Dr. Adolph Gundersen. The $300 scholarship is to be awarded annually in

June to the student graduating that year from a La Crosse high school who shall be judged by a committee representing teachers of science from the city high schools to be the leading student in sciences and the one most likely to make a contribution after college or university training in that field. Selection will be based on scholastic record in biology, chemistry and physics, standing in a science aptitude test and general ability in all subjects. Officers of the foundation are Dr. Sigurd Gundersen, president, Dr. Gunnar Gundersen, vice president, M. P. Jonsrud, secretary-treasurer, and Fred E. Steel and Dr. Alf H. Gundersen, directors.

ALASKA

Territorial Election.—Dr. Paul B. Haggland, Fairbanks, has been named president-elect of the Alaska Territorial Medical Association and Dr. Arthur N. Wilson, Ketchikan, installed as president. Other officers are Dr. Dwight L. Cramer, Ketchikan, vice president, and Dr. William P. Blanton, Juneau, secretary treasurer.

HAWAII

Clarence Carpenter Dies.—Clarence W. Carpenter, M.S., pathologist for the Hawaiian Sugar Planters' Association Experimental Station, Honolulu, died in Honolulu February 21, aged 58.

Territorial Journal Includes Nurses' Activities.—The *Hawaii Medical Journal,* the official publication of the Hawaii Territorial Medical Association, with the January-February issue became the official publication also of the Hawaii Territorial Nurses Association.

Personal.—Bernard Witlin, acting director of the bacteriologic laboratories of the Hawaii Board of Health, has resigned to accept a position with the Ohio State Health Department, Columbus, it is reported. Dr. Pauline G. Stitt, Buffalo, assistant director of the bureau of maternal and child health and crippled children, has resigned to become a regional medical consultant of the U. S. Children's Bureau for the southeastern section of the United States.——The title of Dr. Richard K. C. Lee, Honolulu, director of public health in the Territory, has been changed to assistant health executive in order to conform to the mainland practices, the Honolulu *Advertiser* reported recently.

Physicians Honored.—On December 7 Honolulu County Medical Society held a special meeting to honor sixty-five physicians from Hawaii who have been engaged in military service during the war. Seventeen of the group were present at the meeting. Each one was presented with a certificate from the society with the names of all the men surrounding a figure which symbolized the history of medicine in Hawaii. Floral leis symbolizing the "kindly aloha felt by all the civilian members toward their service brothers" were presented to the doctors who were honored on their return and to the following physicians who presented the program:

Comdr. Stanley J. G. Nowak (MC), Surgery of the Sympathetic Nervous System: Indications.

Lieut. Comdr. Samuel H. Gray (MC), Recurrent Acute Pancreatitis: Clinical Considerations.

Lieut. Comdr. Charles W. Peabody (MC), Internal Derangements of the Knee Joint: Types and Treatment.

Lieut. Comdr. Clayton B. Ethridge (MC), Acute Pericarditis Simulating Coronary Thrombosis: Differential Considerations.

GENERAL

Medical Golfing Association.—The American Medical Golfing Association will hold its thirtieth annual tournament at San Francisco Golf and Country Club, San Francisco, July 1. Dr. James W. Morgan, 384 Post Street, San Francisco, is chairman of arrangements for the San Francisco tournament. Applications for fellowship in the American Medical Golfing Association may be obtained by writing the secretary, Mr. William J. Burns, 2020 Olds Tower, Lansing 8, Mich.

Dr. Weaver Joins Infantile Paralysis Foundation.—Harry M. Weaver, Ph.D., senior administrative assistant and assistant professor of anatomy, Wayne University College of Medicine, Detroit, has been named assistant to the medical director of the National Foundation for Infantile Paralysis. Dr. Weaver's work will be with the foundation's research program and fellowship training program for physicians and research workers. Dr. Weaver received his Ph.D. at Ohio State University. He has been a member of the faculty of the Wayne University since 1938.

International Health Conference.—The Economic and Social Council of the United Nations Organization decided on February 15 to hold an international health conference in Paris beginning June 20, the New York *Times* reported. A special preparatory committee was going to Paris in a short time to prepare the agenda. The conference will consider the establishment of machinery for international action in the field of public health. The Soviet delegate in the council urged delaying the conference until 1947, but the United States, Britain and China declared that the question of world health constituted an urgent problem.

Narcotic Violations.—The U. S. Bureau of Narcotics, Treasury Department, Washington, D. C., has announced the following:

Dr. Joseph Herman Freedman alias Joseph H. Freeman, Hamilton and Cincinnati, Ohio, following his pleas of guilty to false execution of narcotic prescriptions, was on Oct. 22, 1945 sentenced to a term of two years, which was suspended and he was placed on probation for two years. This sentence is to commence at the expiration of a sentence of a term of one year and one day, also given on October 22, for violation of the federal narcotic law.

Dr. Frederick C. Steuart, Manchester, N. H., following his plea of guilty to violation of the federal narcotic law was on September 12 sentenced to a term of one year and one day, which was suspended and he was placed on probation for a period of two years.

Dr. Frank Richard Stephenson, Alto, Ga., pleaded guilty to violation of the federal narcotic law October 22 and was sentenced to serve a term of one year and one day.

Dr. Edmund C. Snavely, Sedalia, Mo., pleaded guilty October 15 to violation of the federal narcotic law and was sentenced to a term of one year and one day, placed on probation for five years to begin at the expiration of prison sentence. On November 15 the original sentence was modified, received a fine of $1,500 and placed on probation for five years.

Dr. Lee A. Butler, Lafayette, La., pleaded guilty January 9 to a narcotic violation, sentence suspended and placed on probation for five years, fined $5,000.

Dr. King David Cammack, Chicago, pleaded guilty to narcotic violation, on November 7 sentenced to term of two years, which was suspended, placed on probation for two years.

Dr. Roy Herndon Cox, Chicago, pleaded nolo contendere to narcotic violation, on January 17 placed on one year's probation.

Dr. Simon Bloom, New York, following his conviction of narcotic violation was on Dec. 14, 1945 sentenced to a term of one year and one day.

Dr. Ralph B. Brown, Columbus, Ohio, pleaded guilty to narcotic violation, on January 14 sentenced to a term of five years, sentence suspended, placed on probation for five years.

Dr. Joseph E. Fudell, Brooklyn, pleaded guilty to narcotic violation, on November 26 sentenced to a term of three years' probation.

Dr. Wyman W. Harden, Columbia, S. C., pleaded nolo contendere to narcotic violation, on November 26 sentenced to a term of two years and fined $500; sentence was suspended and he was placed on probation for a period of five years.

Dr. Ellis G. Klingler, Chicago Heights, Ill., pleaded nolo contendere to narcotic violation, found guilty November 5 and sentenced to a term of two years, sentence suspended and he was placed on probation for two years.

Dr. Berrien W. Kendall, Columbia, S. C., pleaded guilty to narcotic violation, on November 6 sentenced to a term of five years' probation.

Dr. William S. Knox, Waynesburg, Pa., pleaded guilty on Sept. 26, 1945 for narcotic violation and sentenced to a term of two years.

Dr. Roy T. Haskell, Akron, Ohio, pleaded guilty to narcotic violation and on December 11 was sentenced to pay a fine of $500.

Dr. Harrison B. Jewell, Perry, Iowa, and Dr. John H. Jewell, Coon Rapids, Iowa, pleaded guilty to narcotic violation, on Nov. 13, 1945 sentence postponed and each defendant was placed on probation for a period of three years.

Dr. David Newman, Bronx, New York, pleaded guilty to narcotic violation and on October 22 was sentenced to a term of two years probation.

Dr. Robert E. Rahm, San Antonio and Falls City, pleaded guilty to narcotic violation on January 24, sentence suspended and placed on probation for five years on condition that he surrender his special tax stamp and refrain from applying for registration under the federal narcotic law during period of probation.

Dr. Walter C. Rohrkaste, Pittsburgh, pleaded guilty to narcotic violation and on Dec. 4, 1945 sentence was suspended and he was placed on probation for five years.

Dr. Charles Hudson Turner, Dallas, on November 5 was sentenced to serve a term of eighteen months; court also recommended that he be incarcerated in U. S. Public Health Service Hospital, Lexington, Ky.

Dr. Carl W. Wagar, Kalamazoo, Mich., pleaded nolo contendere on November 9 to narcotic violation, on November 15 was sentenced to a term of two years and placed on probation for three years, probation to commence at expiration of penitentiary sentence.

Dr. James Andrew Wren, Lockwood, Mo., pleaded guilty Oct. 1, 1945 to narcotic violation; on same date sentence was suspended and he was placed on probation for two years.

Dr. Ashley Barrington Weathersbee, Cross Hill, S. C., pleaded guilty to narcotic violation, on October 12 was sentenced to a term of fifteen months.

Contact Lens Conference.—The second Contact Lens Conference will be held at the Knickerbocker Hotel, Chicago, May 2-3. On the first day members will hear reports from the organizing committee of the Society for the Advancement of Contact Lens Research and there will be election of officers and a board of directors of the organization. The second day will be devoted to the presentation of scientific papers and case histories. Each paper will not exceed fifteen minutes' reading time. It is urgently requested that all papers planned to be submitted at this meeting be forwarded to the chairman of the organizing committee, Mr. Philip L. Salvatori, 49 East 51st

Street, New York, on or before April 1. In order that adequate reservations may be provided, it is requested that all those who desire to attend this conference communicate promptly with the temporary chairman, Mr. Salvatori. A refresher course on the latest technics in fitting contact lenses will be given, free of charge, to all Obrig contact lens users and students and graduates from the Obrig School for Contact Lens Technicians. This refresher course will be held on the day following the two day meeting of the Society for the Advancement of Contact Lens Research. The society was organized at a meeting in New York Nov. 18, 1944 (The Journal, Dec. 16, 1944, p. 1041).

Association of Electroencephalographers Formed.—On March 1 the Eastern Association of Electroencephalographers was formed at a meeting in the Graduate Club of the Institute of Living, Hartford, Conn., to promote research in the field and plan to pool scientific information concerning the neurophysiology and clinical application of electroencephalography. Lieut. Comdr. Robert S. Schwab (MC) of the United States Naval Hospital, Boston, was elected chairman of the association, and Dr. Charles W. Stephenson, Hartford, was elected recorder. One of the immediate projects of the group is to approach the American Physiological Society, the American Neurological Society, the American Psychiatric Association and the Council on Physical Medicine of the American Medical Association on the matter of establishing a joint committee among the several organizations for the purpose of considering the desirability and means of establishing minimum standards for approved electroencephalographic laboratories. Chairman of the committee appointed to pursue this project is Dr. Hallowell Davis, associate professor of physiology at Harvard Medical School, Boston; members are Dr. Paul F. A. Hoefer, assistant professor of neurology at Columbia University College of Physicians and Surgeons, New York, and Dr. Margaret A. Kennard, assistant professor of neuropsychiatry and neuroanatomy at New York University College of Medicine. Wladimir T. Liberson, director of the physiologic research laboratory at the Institute of Living and professor at the Ecole des Hautes Etudes in New York City, was appointed chairman, and Leslie F. Nims, Ph.D., assistant professor of physiology, Yale University School of Medicine, New Haven, and Margaret B. Rheinberger, Ph.D., who is in charge of the electroencephalographic laboratory at Montefiore Hospital for Chronic Diseases in New York, were appointed members of the organization and program committee. The newly formed association will meet bimonthly. The next meeting will be on April 12 at the Institute of Living, at which time a draft of the constitution and by-laws will be presented.

PUERTO RICO

New Rural Dispensaries.—Under the auspicies of the Puerto Rican emergency program, construction of seventeen new medical centers in the rural areas of the island has already been started. It is the purpose of this government agency to coordinate the services of these rural dispensaries with the service of the municipal hospitals in the construction program. The insular government contemplates the construction of about 128 rural units, costing about $1,056,000. An investment of about $256,000 will be made in this construction program up to June 30, from which the cost of construction of the seventeen new medical centers in the rural zone will be covered. It is also expected that the insular legislature in its regular February session will pass appropriations amounting to $230,000, which is the additional money needed for the rest of the 1946 program. Of the remainder, $300,000 has been recommended by the planning board to be allocated during the fiscal year 1947-1948, and $270,000 during 1948-1949.

Hospital Construction Program Approved.—The planning board of Puerto Rico has approved a program for the construction of municipal hospitals in the island, where twenty-two municipalities, with a population of about 319,766, are lacking hospital facilities for indigent patients, and less than one half of such a great number of people have the services of a resident physician. The program calls for the investment of about $1,064,000 during the next three years if materials and equipment can be obtained. One bed for each thousand inhabitants is contemplated. At present the Department of Health of Puerto Rico has an allocation of $400,000 voted by the insular legislature for the construction of the first fifteen units, and $50,000 for preparation of plans, specifications and the purchase of land. According to the proposed plan, preference will be given to the construction of municipal hospitals in communities that now lack the service. Distribution of such facilities is to be made on the basis of the 1940 census of the island. The insular legislature is expected to vote the rest of the needed allocation of funds this month. A survey of hospital facilities in Puerto Rico made under the auspices of the health department last year indicates that of the seventy-seven municipalities on the island only fifty-five have hospital facilities, either through government units, district hospitals or private clinics. Of these fifty-five municipalities only thirty-four have a bed capacity of one or more per thousand inhabitants.

FOREIGN

Medical Libraries Aided.—Rehabilitation of medical libraries in the liberated countries of Europe is to be undertaken by the British Royal Medical Society, which will establish a central library bureau with the grant of almost £62,000 from the Rockefeller Foundation. The fund is to cover maintenance for four years.

Chinese Medical Journal Returns to China.—The *Chinese Medical Journal,* which during the war issued its editions in Washington, D. C., has resumed publication from Shanghai. Szeming Sze, editor, gives the address as the Chinese Medical Journal, Chinese Medical Association, 41 Tszepang Road, Shanghai, China.

Congress of French Speaking Electrocardiologic Physicians.—Under the presidency of Dr. Louis Delherm, Paris, the fourth Congress of French Speaking Electrocardiologic Physicians will be held in Paris on the same date as the Congress of Surgery, October 9-12. Three subjects will be discussed: Dr. Albert Lachapele, Bordeaux, on critical study of chronic vertebral rheumatism, Mm. Paul Cottenot, Lamarque and E. Gros on roentgen therapy by contact, and Professors Roger Baudoin and H. Fischgold on possibilities and limitations of electroencephalography. Address all correspondence to Dr. E. Cherigie, 9 Rue Daru.

Personal.—Sir William Ogilvie, London, has been appointed editor of the *Practitioner,* to succeed Dr. Alan A. Moncrieff, London, who has resigned on his appointment to the Nuffield professorship of child health at the University of London. Sir William, who received his knighthood in the New Year Honors list for distinguished services during the war, is surgeon to Guy's Hospital, a vice president of the Royal College of Surgeons and honorary major general and consultant surgeon to the British army. Dr. Moncrieff has been senior editor of the *Practitioner* since 1943, when he succeeded the late Sir Humphry Rolleston. Dr. William A. R. Thomson, London, who joined the *Practitioner* in 1944, will continue as associate editor.

Health in Czechoslovakia.—As a result of six years of German occupation, Czechoslovakia's national health is the gravest of its complicated postwar problems of recovery. With no complete postwar statistics on hand, social insurance data alone indicate an alarming increase of tuberculosis (200 per cent increase for men, 100 per cent for women). Both the people and their government are fully aware of the situation, which is aggravated by the loss of about 5,000 physicians during the occupation. At the faculty of medicine of Charles University in Prague the registration of medical students is four times its prewar size. Additional branches of the Prague faculty have been established in Plzen and Hradec Kralove. Overcrowding, combined with lack of equipment and literature, also hamper the medical faculties of Brno and Bratislava. Notes which students take of professors' lectures in overfilled classrooms are their only textbooks. Yet their professors have no source material on the tremendous progress in research and the practical achievements of American medical science in the past six years. In print and public meetings voices are being raised all over the country asking for these important tools, chiefly American medical journals. Urgent appeals are arriving from deans of medical schools and heads of large hospitals, each of which asks anew, in pathetic need and bewilderment, why no help is reaching them. Some medical books and journals donated to Prague have recently been shipped by the Masaryk Institute in New York, a depository for national and Charles University Library. These generous donations of institutions and private physicians will provide only a trickle of single copies which are to be divided among numerous medical institutions. Physicians who wish to contribute periodicals need only to ship these periodicals in cartons, collect, to Masaryk Institute, 8 West 40th Street, New York 18, where they are catalogued and packed for overseas shipping. Each volume carries an ex libris with the name of the donor and thus provides a permanent record of the individual's contribution to the rebirth of Czechoslovakian science.

CORRECTION

Chief of Surgical Service.—In a recent item under Army Awards and Commendations, Lieut. Col. Oscar E. Nadeau's position was incorrectly given and should have read "chief of surgical service, Fletcher General Hospital."

Deaths

Harold Eugene Robertson ⊕ Rochester, Minn.; University of Pennsylvania Department of Medicine, Philadelphia, 1905; born in Waseca, Minn., Oct. 8, 1878; professor of pathology at the University of Minnesota Graduate School, Minneapolis; formerly instructor in pathology at the Albany (N. Y.) Medical College and the Harvard Medical School in Boston, where he was assistant pathologist of the Boston City Hospital; served as instructor in pathology and bacteriology, assistant professor, associate professor and professor of pathology at the University of Minnesota Medical School, Minneapolis, where he was director of the department of pathology, bacteriology and public health from 1917 to 1921; member and past president of the American Association of Pathologists and Bacteriologists and the International Association of Medical Museums; member of the Minnesota Academy of Medicine, Alumni Association of the Mayo Foundation and the American Society of Clinical Pathologists; member of the American Society for the Control of Cancer and its board of directors; fellow of the American College of Physicians; served as a major with the American Expeditionary Forces during World War I; colonel, medical reserve corps, U. S. Army, not on active duty; senior consultant and formerly head of the section on pathologic anatomy, Mayo Clinic; died in the Kahler Hospital March 8, aged 67, of bronchopneumonia and carcinoma of the stomach.

Leon Mitchell Wilbor, Cathedral City, Calif.; University of Buffalo School of Medicine, 1911; born in Le Roy, N. Y., July 29, 1888; member of the American Medical Association and International Hospital Association; fellow of the American College of Hospital Administrators; past president of the Association of Western Hospitals; served during World War I; formerly associated with the U. S. Public Health Service Reserve; served as assistant chief, neuropsychiatric division, medical service, War Risk Insurance, Washington, D. C., when it was taken over by the U. S. Veterans Bureau; formerly medical officer in charge of U. S. Marine Hospital number 5 and U. S. Public Health Service Hospital number 73 both in Chicago, U. S. Veterans Hospital number 74 in Gulfport, Miss., and U. S. Veterans Hospital number 94 in American Lake, Wash.; formerly assistant medical director of the U. S. Veterans Bureau in Washington, D. C.; superintendent of the San Francisco Hospital from Feb. 1, 1928 to Nov. 15, 1943, when he retired; at one time member of the American Psychiatric Institute; died December 5, aged 57, of coronary occlusion.

Burton Thorne Simpson, Buffalo; University of Buffalo School of Medicine, 1903; born in Belleville, N. Y., July 30, 1873; joined the State Institute for the study of Malignant Diseases as resident pathologist in 1910, serving in that capacity until 1924, when he became director, and retiring in 1943 after having reached the compulsory retirement age; formerly associate professor of hygiene and public health at his alma mater; member of the American Medical Association and the American Radium Society; at various times president, vice president, member of the council and board of directors of the American Association for Cancer Research, president and member of the board of directors of the American Cancer Society and member of the scientific advisory board of the International Cancer Research Foundation; served as director of the cancer research division of the state health department and fellow of the Royal Cancer Society of London; died March 5, aged 72, of cardiac dilatation and chronic interstitial nephritis.

Henry Norton Torrey ⊕ Detroit; Johns Hopkins University School of Medicine, Baltimore, 1906; born in Creston, Ia., Oct. 7, 1880; fellow of the American College of Surgeons; served with the Harper unit overseas during World War I; past president of the Michigan Association of Industrial Surgeons; civilian aide to the Secretary of War in the Detroit district during World War II; for many years surgical director of the Michigan Mutual Liability Company; consulting surgeon, Harper Hospital; affiliated with the Michigan Mutual Hospital; member of the board of trustees of the Charles Godwin Jennings Hospital, where he died December 28, aged 65, of cerebral hemorrhage.

Charles Jacob Larkey ⊕ Bayonne, N. J.; University and Bellevue Hospital Medical College, New York, 1904; specialist certified by the American Board of Radiology; member of the Radiological Society of North America and the American College of Radiology; served as deputy health officer, chief medical inspector to the city board of education and health officer; member of the board of directors and staff of the Bayonne Hospital for many years; taught radiology at Columbia University College of Physicians and Surgeons, New York; on the staff of St. Mary's Hospital, Hoboken; died February 18, aged 62, of carcinoma of the stomach.

Siegfried Wachsmann, Middletown, N. Y.; Friedrich-Wilhelms-Universität Medizinische Fakultät, Berlin, Prussia, Germany, 1891; born in Gleiwitz, Germany, Dec. 24, 1864; member of the American Medical Association; fellow of the New York Academy of Medicine; formerly professor of clinical medicine at the Columbia University College of Physicians and Surgeons and the Fordham University School of Medicine, both in New York; served on the staffs and as medical director of the Montefiore and Sydenham hospitals of New York; died February 18, aged 81, of arteriosclerosis.

Julian Adair ⊕ Wilmington, Del.; Hahnemann Medical College and Hospital of Philadelphia, 1902; past president and secretary of the Homeopathic Board of Medical Examiners; served on the city board of health; president of the staff of the Memorial Hospital, where he died November 2, aged 65, of carcinoma of the prostate.

Frank A. Baker, Fall River, Mass. (licensed in Massachusetts under the Act of 1894); died November 18 of generalized arteriosclerosis.

Fredrick Brown, Valley City, N. D.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1905; member of the American Medical Association; chief of staff, Mercy Hospital; died November 13, aged 65, of coronary occlusion.

Harvey Simpler Brown, Freehold, N. J.; College of Physicians and Surgeons, Baltimore, 1899; member of the American Medical Association; served during World War I; for many years a member of the board of health, medical inspector and registrar of vital statistics; past president of the New Jersey State Health Officers Association; died in the U. S. Naval Hospital, Philadelphia, December 17, aged 70.

J. E. Christian, Duluth, Ga.; Atlanta Medical College, 1893; died November 11, aged 78.

Floyd Ferdinand Clark, Duluth, Minn.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1908; member of the American Medical Association; at one time deputy coroner of St. Louis County; on the staff of St. Mary's Hospital, where he died November 15, aged 69, of coronary occlusion.

James Harvey Clark ⊕ Carmel, Calif.; Johns Hopkins University School of Medicine, Baltimore, 1936; died recently in Austria, where he was serving for the United Nations Relief and Rehabilitation Administration, aged 47, of heart disease.

Henry Tyler Coleman, Pattonville, Mo.; Washington University School of Medicine, St. Louis, 1895; member of the American Medical Association; died December 19, aged 71, of coronary occlusion.

Francis Aloysius Cregg, Lawrence, Mass.; Jefferson Medical College of Philadelphia, 1905; member of the American Medical Association; died November 29, aged 64, of coronary occlusion.

Adolphus Hamilton Creps, Lima, Ohio; Medical College of Ohio, Cincinnati, 1890; died November 28, aged 78, of bronchopneumonia.

Richard Francis Daly, Marshfield, Mass.; Harvard Medical School, Boston, 1893; died November 30, aged 77, of chronic myocarditis.

Ezra E. Dickason, Brownsville, Texas; University of Louisville (Ky.) Medical Department, 1891; died in December, aged 79, of myocardial failure.

Augustus Sherman Downs ⊕ Saratoga Springs, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1899; on the staff of the Saratoga Hospital; died in Bradford, Pa., December 8, aged 75, of coronary thrombosis.

Joy Harris Glascock, Greensboro, N. C.; Woman's Medical College of Baltimore, 1896; honorary member of the Medical Society of the State of North Carolina; member of the American Medical Association; died recently, aged 82, of myocarditis.

Thomas Wilkin Gunter, Paxville, S. C.; Medical College of the State of South Carolina, Charleston, 1908; died December 27, aged 62, of chronic myocarditis.

Edgar S. Harris, Independence, Mo.; Medico-Chirurgical College of Kansas City, Mo., 1899; died in the Independence Sanitarium and Hospital November 27, aged 68, of uremia.

Herman Leo Harris ⊕ Columbus, Ohio; Ohio Medical University, Columbus, 1897; member of the staff of the Mercy Hospital, where he died December 15, aged 78.

Ernest Downing Hatch, Boston; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1909; formerly associated with the U. S. Public Health Service Reserve; died November 26, aged 74, of generalized arteriosclerosis.

Harry Ashford Haze ⊕ Lansing, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1895; served during the Spanish-American War; on the staff of the Edward W. Sparrow Hospital; member of the first state board of registration in medicine; died December 23, aged 77, of carcinoma of the prostate.

James S. Hedrick, Ada, Ohio; Starling Medical College, Columbus, 1882; died November 6, aged 86, of chronic arthritis and enlarged prostate gland.

Wilbur Randolph Hurst, Pasadena, Calif.; Rush Medical College, Chicago, 1912; fellow of the American College of Surgeons; served during World War I; member of the staffs of the Deaconess, St. Mary's and Welborn-Walker hospitals, Evansville, Ind.; died March 6, aged 60, of heart disease.

William Walter Johnston, Savage, Mont.; University of Minnesota College of Medicine and Surgery, Minneapolis, 1902; died in Byron, Minn., November 12, aged 70, of heart disease.

Robert Turner Jones ⊕ Harford, Pa.; Jefferson Medical College of Philadelphia, 1937; interned and served a residency at the Moses Taylor Hospital in Scranton; began active duty as a captain in the medical corps, Army of the United States, on May 11, 1942; relieved from active duty Oct. 3, 1945; died November 24, aged 35, of coronary thrombosis.

James Rossiter Kellogg, Portage, Wis.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1901; died November 25, aged 70, of heart disease.

Frank J. Kessler, Easton, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1893; member of the American Medical Association; formerly secretary of the Northampton County Medical Society; served as member of the board of education, member of the city civil service commission for selecting policemen, police surgeon and deputy coroner of Northampton County; died in the Betts Hospital December 24, aged 76, of pneumonia.

Walter Ellwood Kiefer, New York; Medico-Chirurgical College of Philadelphia, 1911; member of the American Medical Association; medical examiner for the Pennsylvania Railroad; died recently in Arlington (Va.) Hospital, aged 62, of coronary thrombosis.

John Ferdinand Klinedinst ⊕ York, Pa.; University of Maryland School of Medicine, Baltimore, 1889; member of the American Academy of Ophthalmology and Otolaryngology; formerly member and secretary of the U. S. Examining Board for Pensions in York County; past president of the York County Medical Society; on the staff of the York Hospital, where he was a member of the board of directors and where he died December 6, aged 78, of cerebral hemorrhage.

Emory Leroy Kniskern ⊕ Muskegon, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1895; past president of the Muskegon County Medical Society; on the staff of the Hackley and Mercy hospitals and the Muskegon County Sanatorium; died January 26, aged 77, of subacute bacterial endocarditis.

Benjamin Franklin Lorance ⊕ Auburn, Neb.; State University of Iowa College of Medicine, Iowa City, 1887; served as secretary of the Nemaha County Medical Society; county medical adviser; author of "Medi-Cult"; died December 4, aged 87.

Frank Cyrus McCue ⊕ Charlottesville, Va.; University of Virginia Department of Medicine, Charlottesville, 1898; formerly secretary-treasurer of the Albemarle County Medical Society; at one time superintendent of the Martha Jefferson Hospital and Sanitarium; died December 1, aged 71, of coronary occlusion.

William Andrew McKenney ⊕ Falmouth, Ky.; Medical College of Ohio, Cincinnati, 1890; served during World War I; secretary of the Bracken-Pendleton Counties Medical Society; county health officer; at one time chairman of the county democratic committee; died December 24, aged 78, of heart disease.

John M. McMillan, Candor, N. C.; Atlanta College of Physicians and Surgeons, 1909; member of the American Medical Association; honorary member of the Medical Society of the State of North Carolina; on the courtesy staff of the Moore County Hospital in Pinehurst, where he died December 6, aged 63, of coronary heart disease.

Clifford David Mercer ⊕ West Union, Iowa; Northwestern University Medical School, Chicago, 1908; fellow of the American College of Physicians; life member of the Iowa State Medical Society; past president of the Fayette County Medical Society; served during World War I; commissioner of insanity for Fayette County for fifteen years; member of the medical advisory board, World War II; health officer of West Union for twenty-five years; on the staff of the West Union Hospital; died December 25, aged 61, of coronary occlusion.

Frederick Walter Minty ⊕ Rapid City, S. D.; Sioux City College of Medicine, 1904; fellow of the American College of Surgeons; on the staffs of the Black Hills General and St. John's hospitals; died November 24, aged 63, of coronary thrombosis.

Frank Armington Morrill, Somerset, Mass.; College of Physicians and Surgeons, medical department of Columbia College, New York, 1876; died December 30, aged 92, of mitral insufficiency.

Charles L. Mullins, Phoenix, Ariz.; Omaha Medical College, 1891; found dead recently, aged 78.

Mary A. Naylor, Pittsburgh; Woman's Medical College of Pennsylvania, Philadelphia, 1909; for many years medical examiner for the board of education in Pittsburgh; at one time taught in the public schools in Oil City, Pa.; died December 8, aged 78, of cerebral hemorrhage.

Douglas Steffian Nisbet ⊕ Passed Assistant Surgeon, U. S. Public Health Service, Philadelphia; University of Pennsylvania School of Medicine, Philadelphia, 1940; entered the public health service in 1941; diplomate of the National Board of Medical Examiners; died in the U. S. Marine Hospital, Baltimore, January 25, aged 30, of carcinoma of the testis.

John Howard F. O'Neil ⊕ Chicago; Illinois Medical College, Chicago, 1904; died in the Evangelical Hospital December 20, aged 61, of cirrhosis of the liver and hemorrhage from bleeding esophageal varices.

Alfred Vandiver Parsons, Washington, D. C.; University of Maryland School of Medicine, Baltimore, 1889; died in the Garfield Hospital December 29, aged 82, of bronchopneumonia and adenocarcinoma of the ascending colon.

James William Payne, Monticello, Ga.; Atlanta Medical College, 1914; died recently, aged 56, of carcinoma of the mouth.

Meyer Perlstein, Newton, Mass.; Middlesex University School of Medicine, Waltham, 1939; died in Boston November 11, aged 36, of carcinoma of the colon.

William Henry Phillips ⊕ Cleveland; Cleveland Medical College, Homeopathic, 1893; fellow of the American College of Surgeons; on the staffs of the Huron Road, East Cleveland, and the Glenville Hospital; died December 19, aged 74, of cardiac decompensation.

Ernest Wesley Rimer ⊕ Breckenridge, Minn.; Chicago College of Medicine and Surgery, 1908; a graduate in pharmacy; served overseas in the British medical corps during World War I and as city and county health officer; division surgeon for the Great Northern and Northern Pacific railways; on the staffs of St. Mary Hospital in Wahpeton, N. D., and St. Francis Hospital; died December 22, aged 63, of coronary thrombosis.

Frank Ritter ⊕ Louisville, Ky.; University of Louisville Medical Department, 1911; on the staff of St. Joseph Infirmary; died December 3, aged 58, of coronary occlusion.

George T. Ritter, Williamsport, Pa.; Jefferson Medical College of Philadelphia, 1908; member of the American Medical Association; for three terms a member of the school board, serving as president from 1931 to 1939; awarded the Grit meritorious award in 1937 in recognition of his leadership in educational affairs; died in Johns Hopkins Hospital, Baltimore, recently, aged 68, of pneumonia due to hypernephroma.

Fred Rudnick, Chicago; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1905; member of the city health department; on the staff of St. Elizabeth's Hospital; died in the Norwegian American Hospital December 21, aged 71, of cerebral hemorrhage.

Charles Montgomery Russell, Columbia, Ky.; Kentucky School of Medicine, Louisville, 1890; University of Louisville Medical Department, 1891; past president of the Adair County Medical Society; for many years county coroner; died December 6, aged 75, of chronic myocarditis.

Henry Leonidas Scarborough, Conway, S. C.; Medical College of the State of South Carolina, Charleston, 1912; member of the American Medical Association; on the staff of the Conway Hospital; died December 18, aged 59, of coronary thrombosis.

William H. Schnell ⊕ Superior, Wis.; Milwaukee Medical College, 1912; formerly associated with the U. S. Public Health Service; served as chief surgeon of the Great Northern and the Soo Line railroads and as chief of staff of St. Mary's Hospital, where he died December 9, aged 60, of coronary occlusion.

Dixie C. Secord, Sumner, Neb.; Western University Faculty of Medicine, London, Ont., Canada, 1906; died December 4, aged 63, of uremia.

Edwin Stanton Sherrill, Detroit; College of Physicians and Surgeons, medical department of Columbia College, New York, 1885; served as city health officer and member of the board of education; in 1920 the Edwin S. Sherrill Elementary School was named for him; died December 30, aged 91, of cardiac decompensation and bronchopneumonia.

Ferdinand Shoemaker ⊕ Kansas City, Mo.; Georgetown University School of Medicine, Washington, D. C., 1891; member of the American Academy of Ophthalmology and Otolaryngology and the Medical Society of the State of Pennsylvania; fellow of the American College of Surgeons; formerly affiliated with the Indian Service and with the Veterans Administration facilities in Excelsior Springs and Kansas City; died in St. Mary's Hospital December 19, aged 77, of carcinoma of the colon.

Harry Marquis Smith ⊕ Canandaigua, N. Y.; University and Bellevue Hospital Medical College, New York, 1912; fellow of the American College of Surgeons; at one time county coroner; affiliated with the Frederick Ferris Thompson Hospital; medical examiner and surgeon for the Pennsylvania and New York Central railroads; died December 27, aged 57, of coronary occlusion.

George Reuben Sorrell ⊕ Washington, D. C.; Columbian University Medical Department, Washington, D. C., 1898; died in the Sibley Hospital December 10, aged 69, of cerebral hemorrhage and cardiovascular renal disease.

Nathan W. Stallard, Dungannon, Va.; College of Physicians and Surgeons, Baltimore, 1885; past president of the Scott County Medical Society; member and chief examining physician of the Scott County Draft Board during World War I; for many years pension examiner for the war department, secretary of the county board of health and postmaster of Dungannon; served as a member of the town council; died December 18, aged 83, of cardiac failure.

Thomas Milton Stewart ⊕ Cincinnati; Pulte Medical College, Homeopathic, Cincinnati, 1887; formerly professor of ophthalmology at his alma mater; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; served as a member of the staff of the Bethesda Hospital, where he died December 10, aged 79, of duodenal ulcer.

George G. Strickland, Philadelphia; Howard University College of Medicine, Washington, D C, 1898; one of the founders and for many years affiliated with the Mercy Hospital; died December 27, aged 76, of arteriosclerosis

Samuel Meredith Strong ⊕ Flushing, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1902; past president of the Dutchess County Medical Society; served during the Spanish-American War and World War I; affiliated with the Flushing Hospital; died in the Columbia Presbyterian Medical Center, New York, February 2, aged 68, of carcinoma of the stomach.

John Ritter Sutter ⊕ Edwardsville, Ill.; Washington University School of Medicine, St. Louis, 1907; for many years county physician; died December 3, aged 64, of coronary heart disease.

Walton Tackett, East Moline, Ill; Barnes Medical College, St Louis, 1907; member of the American Medical Association and the American Psychiatric Association; affiliated with the East Moline State Hospital, where he died December 14, aged 66, of coronary occlusion.

Gertrude Frances Thompson, Chicago; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1903; member of the American Medical Association; on the staff of the Women and Children's Hospital; died December 29, aged 78, of coronary thrombosis.

Thomas Lewis Thomson, Kingsmill, Ont.; Western University Faculty of Medicine, London, Ont., Canada, 1905; for many years a practitioner in Ann Arbor, Mich.; died in the Victoria Hospital, London, Ont., December 4, aged 67, of hypertensive heart disease with mesenteric artery thrombosis.

James B. Transou, Atlanta, Ga.; Meharry Medical College, Nashville, Tenn, 1917; died December 7, aged 52, of hypertensive heart disease.

Benjamin Vaughan ⊕ Louisville, Ky.; Louisville Medical College, 1906; on the staff of the SS. Mary and Elizabeth Hospital, where he died December 9, aged 66, of cerebral hemorrhage.

Robert Andrew Warren ⊕ Cleveland; Western Reserve University School of Medicine, Cleveland, 1914; member of the Cleveland Academy of Medicine; on the staffs of the Huron Road Hospital, East Cleveland, and the Woman's Hospital, where he was formerly chief of staff; died December 25, aged 61, of coronary thrombosis.

Frederick William Weston ⊕ Tustin, Calif.; University of Toronto Faculty of Medicine, Toronto, Ont., Canada, 1913; died December 1, aged 61, of coronary occlusion.

DIED WHILE IN MILITARY SERVICE

Gordon Horatio Hammill, Euclid, Ohio; Ohio State University College of Medicine, Columbus, 1928; member of the American Medical Association; began active duty as a captain in the medical corps, Army of the United States, on Sept. 23, 1942; died in Japan Oct. 4, 1945, aged 41, in an airplane crash.

Clinton Childs Horton Jr., Pendleton, S. C.; Emory University School of Medicine, Atlanta, 1944; interned at the Roper Hospital in Charleston; commissioned a lieutenant (jg) in the medical corps of the U. S. Naval Reserve on July 1, 1945; stationed in the psychiatric section of the Naval Hospital in New River, N. C.; killed Oct. 3, 1945, aged 24, in an automobile accident near Fayetteville, N. C.

Hickman Clark Howell, Springfield, Mo.; St. Louis University School of Medicine, 1943; interned at St. John's Hospital in St. Louis; began active duty as a first lieutenant in the medical corps, Army of the United States, on Sept. 15, 1944; accidentally drowned in Luzon, P. I., Sept. 9, 1945, aged 25, while boating on a lake.

Charles Floyd Jump ⊕ Helena, Mont.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1904; member of the Montana Academy of Otolaryngology; commissioned a lieutenant in the medical corps of the Second Montana Infantry; from June to November 1916 served as a captain in the Montana National Guard along the Mexican border; served as a major with the 163d infantry in France during World War I; discharged Aug. 6, 1919; began active duty as a major in the medical corps, Army of the United States, on Sept. 5, 1942, assigned as state medical officer for the Montana headquarters of Selective Service; promoted to lieutenant colonel; died in the Veterans Administration Facility, Fort Harrison, Oct. 23, 1945, aged 63, of coronary occlusion.

James Wilson Mader Jr., McKeesport, Pa.; University of Pennsylvania School of Medicine, Philadelphia, 1937; interned at the Western Pennsylvania Hospital in Pittsburgh; served as a fellow in surgery at the Mayo Foundation in Rochester, Minn.; began active duty as a lieutenant (jg) in the medical corps of the U. S. Naval Reserve on Aug. 4, 1941; later promoted through the grades to commander; died in Mexico City, Mexico, Dec. 19, 1945, aged 32, of heart disease.

John A. Marsico, Elyria, Ohio; Ohio State University College of Medicine, Columbus, 1930; member of the American Medical Association; interned at St. Francis Hospital in Columbus; captain, medical corps, Army of the United States; captured by the Japanese in the fall of Corregidor in 1942; died in Japan Jan. 27, 1944, aged 39, of cerebral hemorrhage.

Thomas William Miller ⊕ Alton, Ill.; St. Louis University School of Medicine, 1927; interned at St. Mary's Hospital in East St. Louis and St Luke's Hospital in Chicago; on the staffs of St. Joseph's and Alton Memorial hospitals; began active duty as a lieutenant commander in the medical corps of the U. S. Naval Reserve on May 3, 1943; died in San Francisco Aug. 29, 1945, aged 43, of extreme multiple injuries received in an automobile accident.

Charles Joseph Mooter, Omaha; Creighton University School of Medicine, Omaha, 1941; interned at the Creighton Memorial St. Joseph's Hospital; began active duty as a first lieutenant in the medical corps, Army of the United States, on July 1, 1942; promoted to captain; died in New Caledonia Dec. 15, 1944, aged 27, in an automobile accident.

Foreign Letters

LONDON LETTER

(From Our Regular Correspondent)

Feb. 28, 1946.

An Improved Mental Health Service: Mental Disorders Not Increased by the War

An important survey of neurotic disorders and treatment facilities by Dr. C. P. Blacker has just been published in book form entitled "Neurosis and Mental Health Services." It was carried out with the encouragement of the Ministry of Health and the assistance of experts and is largely based on reports from 216 clinics dealing with mental disorder. The origin of the survey was the question of the possible increase in neurotic disorders as the result of air raids. The important conclusion is reached that there are no grounds for supposing that the war has caused an increase in the more serious forms of mental disorder requiring admission to a hospital. This is remarkable in view of the heavy bombing, with considerable loss of life and injuries to persons and destruction of buildings in our cities while the country was passing through the greatest danger to which it ever was exposed. Few persons were without acute anxiety for husband, son or friend fighting for more than five years all over the world. The absence of increase in the serious forms of mental disorder is in consonance with the improvement in vital statistics frequently reported in The Journal. It is evidence of the grit of the people, who for a time faced the German peril alone.

The threat remains that the coming years may show an increase in neurotic disorder as a result of the difficulties of adjustment associated with demobilization and the return of prisoners who have endured German barbarities. Dr. Blacker thinks that it is possible that latent neurosis may reveal itself in the civilian population when the stresses of war are relaxed. The number of mental clinics have been increased as a result of the Mental Treatment Act of 1930, but there are still not enough. Dr. Blacker holds that the problem of psychiatric disorders is largely sociological—that they could be reduced or mitigated by better education of adults in the sensible handling of children, by educational services in which abnormalities are detected early, and by better industrial, occupational and social psychiatry. Teaching psychiatric units should be established in the university medical schools, each under the direction of a professor. Outside mental hospitals with 100 beds for each million of population should be provided for psychiatric inpatients, and outpatient clinics should be extended by 75 to 100 per cent. There should also be child psychiatric clinics. A medical officer of mental health should be appointed for the coordination of mental health services. The picture is a mental health service integrated with the new health service.

The London Municipal Hospital Service

The London County Council maintains seventy-six hospitals, probably the largest unified hospital service in the world. This service is separate from the older voluntary hospitals, to which the London medical schools belong. The council hospitals have developed from municipal infirmaries originally established for the care of the indigent. To convert these institutions into modern hospitals the council since 1930 has spent $20,000,000. There was severe damage from German bombing for which the cost of necessary repairs is estimated at $10,400,000. A comprehensive report on the restoration and development of the council's general and special hospital service has been made by a committee. It is proposed that more units be provided for specialized treatment and for rehabilitation in addition to those already established before the war. These centers include special units for the treatment of thyroid disease, rheumatism, diabetes, plastic surgery, thoracic surgery and radiotherapy, neurosurgery and fractures.

War Work of the American Ambulance in London

The American Ambulance in Great Britain, which is being wound up after a distinguished record of war service, has made a gift of $100,000 from its surplus funds to the Middlesex Hospital. The fund will be used to endow two single bed wards to which members of the staff of the American embassy and other citizens of the United States will have first claim. Col. J. J. Astor, chairman of the board of management, said that he had already expressed the nation's thanks for the magnificent work of the American Ambulance. In the hour of our greatest need, when our circumstances were black and indeed desperate, a group of American citizens in London conceived and created it. The gift would perpetuate the good relations which had always existed between the hospital and the American embassy and individual Americans in London. In a further tribute to American organization in the war Surgeon Rear Admiral Gordon-Taylor said that when the College of Surgeons was badly damaged and its Hunterian Museum almost destroyed the American Ambulance came to its aid with seventy-eight ambulances and removed 26,000 specimens to various parts of the country.

German Experiments at Auschwitz Camp

An official, juridically and medically confirmed report is published in the *Nederlandsch Tijdschrift voor Geneeskunde*, **31**:364, 1945, by E. DeWind, physician concerning experiments by the Germans carried out at the Auschwitz Camp on 612 women of various nationalities.

Professor Samuels of Cologne, on instructions from S. S. Hauptsturmführer Wirths, used 200 women, removing under anesthesia parts of the portio uteri for histologic investigation in search of early stages of cancer. Another distressing but less harmful experiment was intravaginal uterine photography. Most of the victims were later killed in gas chambers, and Samuels himself was shot.

Professor Schumann subjected 15 girls of 17 to 18 years of age to ultrashort wave treatment directed at the ovary. Several victims were badly burned, one of them dying as a result of this first stage of the experiment. One month later, transverse and longitudinal laparotomy was performed in two stages for total extirpation and inspection of the ovaries. Nine laparotomies were performed in as many quarters of an hour, without resterilization between these operations. Several mortal and permanently disabling sequels followed.

Professor Clauberg, progesteron expert, together with Dr. Goebel, both Gestapo men, investigated in the majority of the remaining victims substitutes for the x-ray contrast substance lipiodol. These investigations were prompted by a shortage of iodine. The subjects were bought from the S. S. With pressure generated by an electric pump, a viscous fluid was forced into the uterus, under x-ray control and without anesthesia, causing great discomfort. Every subject served for two to six experiments. Some of the victims died as a result of genital or peritoneal infections when the fluid penetrated the abdominal cavity. Many victims who survived were later gassed. About 50 Netherlands women, who lived through Clauberg's experiments, escaped and are expected to return to this country.

S. S. Oberstrumführer Weber and S. S. Oberscharführer Münch performed comparatively innocent blood group, malaria and toxicology tests.

Occasional pregnancies, for which arrangements seem to have existed in the camp, were interrupted in the seventh month, after the fetus had been killed.

Starvation Diseases Under the Japanese in the Far East

A. Colaço Belmonte has recently reported his experiences as a prisoner of war of the Japanese (*Nederl. tijdschr. v. Geneesk.* **32**:419 [Dec.] 1945). During three and one-half years of captivity the average mortality of prisoners of war from hardship and disease was approximately 25 per cent. Adequate medical care was deliberately withheld. Forced labor, chiefly in the coal mines, and systematic starvation lowered the average weight of one group of Australian prisoners of war to 51 Kg., many weighing only 38 Kg. Psychic changes resulted from confinement, particularly since a space of only 67 cm. was allowed each man in some camps in Java. The mortality from pneumonia was 22 per cent. Skin infections, including gangrenous furunculosis, were frequent. In one group in Java the author reports that, despite rapid weight loss, prisoners exhibited unimpaired vigor for about eight months. There was then observed a wide variety of symptoms, including painful extremities not relieved by analgesics, paresthesias, increased sweating of the feet, peroneal paralysis, disturbances of sensation especially for temperature, polyneuritis, deafness and visual disturbances, including central scotomas. Blindness occurred without fundus changes. Beriberi symptoms were not identified, but edema, gait changes due to abductor palsy and anesthesia dolorosa were noted. The response to vitamin and increased protein intake was not as rapid as would be expected from classic descriptions of the cure of deficiency diseases.

BRAZIL

(From Our Regular Correspondent)

São Paulo, Feb. 16, 1946.

Clinical Forms of Schistosomiasis Mansoni

Drs. Cesar Pinto and A. Firmato de Almeida have reported observations on 500 cases of Schistosomiasis mansoni from the northern part of the state of Minas Gerais. The organs which present the most important lesions are the large intestine, the liver, the bladder, the lymph glands and the lungs. They describe a case in a boy aged 12 years with serious involvement of the nervous system, presenting epileptiform and convulsive attacks, hysteria and delirium and generalized colitis as a result of S. mansoni infestation. The nervous phenomena disappeared after treatment with antimony and potassium tartrate. The authors also report 4 unusual cases with localization of a large quantity of S. mansoni eggs in the testes and the presence of eggs in the sperm. Their observations indicate that the incidence of schistosomiasis is increasing in an alarming manner in the northern part of Minas Gerais. Special effort is necessary to avoid the creation of a situation similar to that prevailing in China and in Egypt.

Bone Changes in Pemphigus Foliaceus

There are many cases of pemphigus foliaceus ("wildfire") in the interior of the state of São Paulo. A few years ago a special service was established to combat this puzzling disease. The service is under the competent direction of Dr. João Paulo Vieira and has a hospital for the treatment and study of cases of this disease. Dr. U. Lemos Torres of the hospital has just published a paper in which he describes the frequent occurrence of bone changes in patients affected by pemphigus leading to deformities and fractures. The first problem was to determine the exact nature of the bone dyscrasia and to decide whether these changes had an endocrine basis or were the result of nutritional factors. It is known that endocrine disorders do occur in pemphigus, but they are usually of a secondary nature. Dr. Torres found on the average slightly low levels of caloric intake as well as of calcium, phosphorus and proteins, which is common among the poor patients of São Paulo hospitals. As the majority of the patients had a good appetite, Dr. Torres made a careful study of their metabolism and found that in patients with pemphigus the basal metabolic rate was greatly increased, as a rule, an increase of 50 per cent, but in some cases 100 per cent and even 150 per cent. This condition creates a relative deficiency of calcium, phosphorus and vitamin D in the diet, explaining the bone changes reported and observed in the x-ray examination of more than 80 patients studied in the report.

Brief Items

Dr. E. Velter, a French specialist in ophthalmology, has recently arrived at São Paulo, where he was welcomed by the São Paulo Society of Ophthalmology and the Center of Study of Ophthalmology.

Dr. Beatrice Berle, wife of the American ambassador to Brazil, has been awarded the National Order of the Cruzeiro do Sul for patronizing and stimulating the development of medical and social work in Brazil.

Dr. Ernesto de Souza Campos, professor of bacteriology at the University of São Paulo, has been appointed minister of health, in the new administration of President Eurico G. Dutra. Dr. Campos succeeds Dr. R. Leitão da Cunha, professor of pathology at the University of Rio de Janeiro.

Lieut. Col. S. Uchoa Cavalcante, Major Waldemar Basgal, Capt. Clovis C. de Morais and Capt. O. de Moura Plaisant have been commissioned to study, in the United States, several problems of medicine and surgery connected with the medical corps of the Ministry of Aeronautics.

An institute of radiology has been established at the Medical School of Salvador, state of Bahia, under the direction of Dr. Adelaido Ribeiro. Dr. Coolidge, from the United States, and Drs. Manuel C. Malenchini and Jayme F. Roca, from the Department of Radiology of the Rawson Hospital at Buenos Aires, Argentina, were present at the inaugural ceremony.

Personal

Dr. Gustavo Friozzi, assistant professor of medicine at the University of São Paulo, left for the United States, where he will have special training in diseases of the digestive system at the University of Pennsylvania.

Dr. João de Barros Barreto, who recently resigned as director general of the National Department of Health, has just returned from Washington, D. C., where he was the representative of Brazil at the last meeting of the officers of the Pan American Sanitary Bureau. Dr. Barreto is now director of the Division of Hygiene of the Oswaldo Cruz Institute of Rio de Janeiro.

Marriages

Oscar Lee McFadyen Jr., Fayetteville, N. C., to Miss Frances Donald Cochran of Statesville in February.

Isadore Vanet Epstein, Memphis, Tenn., to Miss Gertrude Sylvia Berman of Washington, D. C., February 10.

Z. Bert Friedenberg, New York, to Miss Ruth B. Stratton of Townshend, Vt., at Philadelphia, February 16.

LeRoy B. Matthews, Memphis, Tenn., to Miss Polly Shaw Townsend in Columbia, S. C., February 17.

Martha Sue Lewandoski, Little Rock, Ark., to Mr. Howard T. Story of St. Joseph, Mo., January 13.

Merrill D. Evans, Kansas City, Mo., to Miss Mary Gentilcore of Youngstown, Ohio, February 9.

Harold D. Freedman, Lenoir City, N. C., to Miss Marjorie E. Fennen of Cincinnati, February 9.

Charles W. Brown Jr., Hamlet, N. C., to Miss Lois Little of Connersville, Ind., February 3.

Cyril Joseph Costello, Temple, Texas, to Miss Julia Ann Leahy in St. Louis in January.

Correspondence

TREATMENT OF SHOCK

To the Editor:—Crossman and Allen (THE JOURNAL, January 26, p. 185) in their remarks on shock state that it has been proved that isotonic solution of sodium chloride is equal or superior to plasma in the treatment of shock. Crossman in his further discussion of his article states that "great numbers of lives and limbs were unquestionably sacrificed by the official adherence to . . . pure plasma infusions." Such statements, based on animal experimentation, are directly contrary to the overwhelming clinical experience of military and civilian physicians and are impossible to reconcile with the proved beneficial results of hundreds of thousands of plasma infusions. My recent service in the army was intimately connected with the production of both plasma and whole blood. I am aware of no basis of fact for Dr. Crossman's remarks.

The specific aim of the treatment of shock is the restoration of an adequate blood circulation to combat anoxemia of the tissues. Shock, accompanied by hemorrhage, should be treated with whole blood transfusions. When whole blood is not available, plasma should be administered until blood can be obtained. The use of plasma is particularly indicated in traumatic or operative shock not associated with hemorrhage. Isotonic solution of sodium chloride is useful for replacement of fluid and electrolytes but will not, per se, overcome severe shock.

It can be inferred from these authors' remarks that the countless physicians in both military and civilian status who have taken pride in the thought that their prompt use of plasma has saved lives have been ill advised, not to mention over thirteen million donors who have given their blood for plasma during the recent war. Such, I do not believe, is true.

LESLIE HUGHES TISDALL, M.D., Brooklyn.

CONGENITAL CATARACTS IN SISTERS WITH CONGENITAL ECTODERMAL DYSPLASIA

To the Editor:—I have read with great interest the suggestion of Dr. S. J. Thannhauser (Differential Diagnosis of Ectodermal Dysplasia and of Rothmund's syndrome, THE JOURNAL, January 26, p. 238) that the patients described are examples of Rothmund's syndrome. I am inclined to agree with his suggestion after looking up the pertinent literature on the subject (including Rothmund, A.: Ueber Katarakt in Verbindung mit einer eigenthumlichen Hautdegeneration, *Arch. f. Ophth.* **14:** 159, 1868. Seefelder, R.: Ueber familiares Auftreten von Katarakt und Poikilodermie, *Ztschr. f. Augenh.* **86**:81 [May] 1935. Schnyder, H. F.: Ueber Katarakt bei poikilodermieartiger Hauterkrankung, *Klin. Monatsbl. f. Augenh.* **92**:408, 1934. Thannhauser, S. J.: Werner's Syndrome [Progeria of the Adult] and Rothmund's Syndrome: Two Types of Closely Related Heredofamilial Atrophic Dermatoses with Juvenile Cataracts and Endocrine Features: A Critical Study with Five New Cases, *Ann. Int. Med.* **23**:559 [Oct.] 1945). I apologize that this syndrome in the literature had not been encountered. In this I was not the only guilty party (Bloch, Bruno, and Stauffer, H.: Skin Diseases of Endocrine Origin (Dyshormonal Dermatoses), Poikiloderma-like Changes in Connection with Underdevelopment of Sexual Glands and Dystrophis Adiposogenitalis, *Arch. Dermat. & Syph.* **19**:22 [Jan.] 1929).

Dr. Thannhauser's explanation of the causation of these allied dermatoses, congenital ectodermal dysplasia of the hydrotic and anhydrotic type and of Rothmund's syndrome, is also a new approach to a perplexing etiologic subject. While the attempt has been generally made to classify these dysplasias under the two headings, there have been so many *formes frustes*, variants and so on that the physician has had to be very agile to keep ahead of the race. Thus Thannhauser (Hereditary Ectodermal Dysplasia of "Anhydrotic Type," with Symptoms of Adrenal Medulla Insufficiency and with Abnormalities of Bones of Skull, THE JOURNAL, March 14, 1936, p. 908) reports a typical anhydrotic type of ectodermal dysplasia with low fasting blood sugar, flat sugar tolerance curve and low blood pressure (adrenal medulla disturbance). Roentgenograms showed exostoses of the tables of the skull. Osseous tissue is of mesodermal origin and this case was not a purely congenital ectodermal dysplasia of the anhydrotic type. I have also had difficulty in putting such a case under the proper heading from the developmental standpoint if we are to continue to use the term congenital ectodermal dysplasia. I regret that I am not sufficiently versed in disturbances of the germ plasm theory, but perhaps this is the best method of explaining these cases: "in ectodermal dysplasia there is a defect restricted to the ectodermal germ layer, while in Rothmund's syndrome a multiple germ plasm defect" is possible as there is blood vessel involvement, mesodermal tissue (Wilkins, Lawson, and Fleischmann, Walter: Ovarian Agenesis, *J. Clin. Endocrinol.* **4**:357 [Aug.] 1944). Of course Rothmund suggested as far back as 1868 that the condition he described was an ectodermal dysplasia, and it is true that most of the involvement found in the disease is of true ectodermal type.

H. N. COLE, M.D., Cleveland.

SEKOV DANGEROUS TO HEALTH

[In THE JOURNAL, Nov. 24, 1945, page 904, appeared an item relative to a product called Sekov, a nostrum containing thyroid, which was being sold in California. Now a letter has been received from the Bureau of Food and Drug Inspections of the California State Department of Public Health defining the present status of the product in California. The letter follows.—ED.]

To the Editor:—We note with interest the article on Sekov which appeared in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION on Nov. 24, 1945, page 904, under "Bureau of Investigation." We note particularly the following statement in said article,

> Thus the public outside of California is to be protected from the risk involved in taking Sekov. Whether the California officials will be willing to "harm home industry" by restricting the sale of Sekov in its own state or simply follow the "caveat emptor" policy, remains to be seen

You have evidently been misinformed as to the method of distribution of Sekov in California. We had already stopped the sale of Sekov prior to the federal government's doing so. One cannot buy at retail a package of Sekov in this state.

This firm, however, has circumvented the California Pure Drugs Act and Pharmacy Law and other laws applicable to such dangerous products as thyroid by having on the payroll of its establishment a licensed medical practitioner who examines and prescribes Sekov to all persons referred to that firm.

We have tried ordering this product through the mail, which requests this firm refused; however, it did mail the order blank to us, and when our undercover agent called at its place of business she was immediately told that it would be necessary to have the firm's doctor make a complete examination and that the fee would be $5 which would be refunded after the purchase of the thirty day supply and any additional supplies which may be suggested by the doctor. In other words, before the average purchaser obtains one treatment she spends approximately $20. We have attempted on eleven different occasions to buy Sekov but we were unsuccessful; however, we could have purchased it had we submitted to the doctor's examination.

The attorney general of the state of California has advised us that owing to the fact that a licensed physician and surgeon prescribes this product we do not have a case.

You can readily see that the modus operandi used by this firm in employing a licensed physician and surgeon to "cover up" for it in carrying on its business presents a far different problem to the state of California than it did to the United States Food and Drug Administration.

If it were not for the fact that there are renegades in the medical profession, California would be able to protect amply any citizen purchasing such a product as Sekov. We have diligently enforced the pure food and drug laws in this state and have successfully restricted the sale of preparations containing thyroid except on the prescription of a licensed medical practitioner, but the mere fact that this firm employs a licensed medical practitioner defeats the purposes of all the laws here in California.

Not with any view in mind of boasting, we want to say that the enforcement of the California Pure Drugs Act and the laws applicable to frauds are enforced in this state.

In view of the facts presented, we feel that the statement implying the laxity of the protection afforded the public in regard to this product here in California should be retracted. We want to say at this time that we hold no animosity against The Journal. In fact, the bureau of which I am chief holds your organization in high regard.

Milton P. Duffy, Los Angeles.
Chief, Bureau of Food and Drug Inspections, Food
and Drug Inspection Section, State of California
Department of Public Health.

RADIUM

To the Editor:—In the article entitled "Radium" in The Journal, January 26, Desjardins and Williams state on page 211 that "in cavernous nevus the course of the disease is favorably influenced" and "the treatment is lengthy and tedious." The second sentence should be qualified by saying that the treatment is lengthy and tedious in respect to extensive and deep seated cavernous angiomas but not so in small and relatively superficial vascular birth marks. Many of them respond readily to treatment with radium plaques.

It should, in my opinion, be stressed that small, slowly growing simple angiomas in infants almost always regress without treatment as the child grows older. Angioma simplex in adults is indeed a rarity.

Attention should also be directed to the fact that the flat vascular nevus—the port wine stain—does not respond to radiation therapy. If the dosage in such lesions is so large as to produce destruction of the blood vessels, then scarring, atrophy and pigmentation will be the final outcome. Port wine stains may often be readily concealed with suitably tinted pastes and creams.

Fred Wise, M.D., New York.

FELLOWSHIPS IN PUBLIC HEALTH

To the Editor:—The New York State Department of Health has available a limited number of fellowships for young physicians desirous of obtaining necessary field and academic experience to qualify for full time public health positions.

Six to twelve months of orientation in field work are provided under the guidance of experienced district state health officers. This is followed by an academic year at a postgraduate school of public health leading to a degree in public health. A generous stipend is allowed during both the field and the academic training periods, and tuition is paid at the school of public health. Candidates for the fellowship must possess at least the following basic qualifications: U. S. citizenship; graduation from a medical school approved by the American Medical Association; one year's internship in a hospital approved for such internship by the American Medical Association; license to practice medicine in New York State or eligibility to take the examination to obtain such license. The upper age limit is 35 years.

Physicians who complete the fellowship are professionally qualified for full time appointment on the staff of most local and state health departments.

In order to complete at least six months' field experience prior to the beginning of the next academic year, candidates must be appointed not later than March 15. A few fellowships are still available. Physicians who are interested in making application should write to the State Department of Health, Albany 1, N. Y.

Edward S. Godfrey Jr., M.D., Albany, N. Y.
Commissioner of Health.

Bureau of Investigation

COSMETICS—ADULTERATED OR MISBRANDED

Abstracts of Notices of Judgment Issued by the Food and Drug Administration of the Federal Security Agency

[Editorial Note.—These Notices of Judgment are issued under the Food, Drug and Cosmetic Act and are designated C. N. J. The abstracts that follow are given in the briefest possible form: (1) the name of the product, (2) the name of the manufacturer, shipper or consigner, (3) the date of shipment, (4) the composition, (5) the type of nostrum, (6) the reason for the charge of misbranding or adulteration, and (7) the date of issuance of the Notice of Judgment—which is considerably later than the date of the seizure of the product and somewhat later than the conclusion of the case by the Food and Drug Administration.]

Alexandra de Markoff Cleansing Cream.—Alexandra de Markoff, Inc., New York. Shipped between Dec. 27, 1943, and March 22, 1944. Adulterated because it contained a hair dye color known as "butter yellow," a non permitted coal tar dye known to possess carcinogenic properties.—[*C.N.J., F.D.C. 102, January 1945.*]

Gold Coast Hair Lacquer.—Robinson Company, Chicago. Shipped August 12, 1943. Adulterated because it contained a poisonous substance (not named) which might have rendered it injurious to those who applied it under the conditions of use prescribed in the label—"Can be sprayed or padded on."—[*C.N.J., F.D.C. 98; January 1945.*]

Hubere Hair Lacquer and Hair Lacquer Pads.—Hubere Cosmetics, Chicago. Shipped between July 28 and August 18, 1943. Both Lacquer and Pads adulterated because they contained a poisonous substance (not named) which might have rendered them injurious to users under the conditions prescribed in the labeling and also those that are customary and usual.—[*C.N.J., F.D.C. 96; January 1945.*] An additional Notice of Judgment, for the same reason as above, was reported in *C.N.J. 97,* issued against Bailey's Beautician Supply Company, Chicago, which had shipped a consignment of Hubere Hair Lacquer Pads July 26 and August 2 and 9, 1943.

Miracle Aid for Wrinkles.—Miracle Products, Chicago. Shipped between Nov. 27, 1943, and June 7, 1944. Composition: essentially water, with small amounts of protein, such as egg white, with salt and perfume. Misbranded because bottle label and accompanying circulars falsely represented that article would be effective in removing wrinkles and double chin, and would supply skin tissue protein to body.—[*C.N.J., F.D.C. 110, January 1945.*]

Oliv-Tone for Hair and Scalp.—Great Atlantic Laboratories, Boston. Shipped Feb. 8 and April 12, 1944. Adulterated because it contained a coal tar color known as "butter yellow," the use of which is forbidden in cosmetics, because of its carcinogenic properties. Misbranded because the name "Oliv Tone" gave the false impression that the product contained olive oil.—[*C.N.J., F.D.C. 103, January 1945.*]

Pierrette Custom Process of Cold Permanent Waving.—Pierrette, Los Angeles. Shipped July 7, 1942. Adulterated because it contained a poisonous substance, ammonium hydrogen sulfide, which might have rendered it injurious to persons applying it under the customary conditions of use.—[*C.N.J., F.D.C. 99, January 1945.*]

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Dental Practice Acts: Conviction for Assault Constitutes a Felony.—Consolidated Laws, chapter 16, article 49, section 1311, subdivision 12 (the Education Law) provides in part that:

> A conviction of felony shall forfeit a license to practice dentistry, and, upon presentation to the department or a county clerk by any public officer or officer of a dental society of a certified copy of a court record showing that a practitioner of dentistry has been convicted of felony, that fact shall be noted on the record of license and clerk's register, and the license and registration shall be marked "canceled"

Petitioner, a licensed dentist, was indicted for assault in the first degree, a felony, and pleaded guilty. Pursuant to the law quoted, his license to practice dentistry was canceled. He then filed suit to annul the action of the defendant State Board of Dental Examiners. From an order confirming the revocation, petitioner appealed to the Court of Appeals of New York.

After the plea of guilty, sentence was suspended and petitioner was placed on probation for five years. It was the petitioner's contention that, since his sentence was suspended and he was placed on probation, he was not "convicted of a felony" within the meaning of those words as they are used in the Education Law. The court said that it had, on occasion, interpreted the word "conviction" to mean a verdict or plea of guilt. The word "convicted" or "conviction" is of equivocal meaning. It may mean the adjudication of guilt; it may mean the adjudication and the judgment or sentence. Continuing, the court said that in a disciplinary proceeding against a member of a profession, where the latter confesses in open court by formal plea of guilt the commission of a felony, it seems to us that the legislature clearly intended such plea to constitute conviction of a felony, even though probation followed rather than commitment to prison. Accordingly the action of the State Board of Dental Examiners in canceling the petitioner's license to practice dentistry was affirmed.—*Weinrib v. Beier, 64 N. E. (2d) 175 (N. Y., 1945).*

Optometry Practice Acts: Legality of Corporate Practice; Optometry Not a Learned Profession.—The plaintiff corporation filed suit to enjoin the defendant optometrist from making any use of a customers' list which he had obtained while in the plaintiff's employ. From a decree dismissing the plaintiff's case for want of equity, the plaintiff appealed to the appellate court of Illinois.

The plaintiff alleged that, in the operation of its retail store, it had for more than fifteen years engaged in the business of selling eye glasses "on prescription from persons authorized under the laws of Illinois to practice optometry or medicine and surgery." From August 1937 to June 1944 defendant was employed in the plaintiff's optical department, and in such position he had complete charge of the list of some five hundred prior customers of the department. He left the plaintiff's employ on a Saturday. The following Monday each name on the list received a letter from the defendant stating that he was entering private practice and soliciting the person's patronage. The plaintiff's complaint then concluded with allegations concerning the value of the list and the damage to the plaintiff resulting from defendant's using this confidential list to his own advantage. The defendant contended that the plaintiff's complaint should be dismissed for want of equity. In support of this he urged that the complaint showed on its face that the plaintiff, a corporation, was performing functions—the practice of optometry—prohibited by law to corporations. The plaintiff contended that the complaint showed no such thing and argued that, on the contrary, a corporation is exempt from the provisions of the optometry practice act.

The act provides, among other things:

> "The following persons, firms and corporations are exempt from the operation of this act: . . . (*b*) . . . firms and corporations who shall sell eye glasses or spectacles in a store, shop or other permanently established place of business on prescription from persons authorized under the laws of this state to practice either optometry or medicine and surgery. . . ." (ch. 91, sec. 29, Ill. Rev. Stat. 1945).

We are of the opinion, said the court of appeals, that plaintiff is a corporation as described in clause (*b*) of section 92, that it sells eye glasses or spectacles on prescription from persons authorized under the statute to practice optometry and that in so doing it is exempt from the operation of the statute. Plaintiff is engaged in a lawful business. The act contemplates that licensed optometrists may be employed. Section 103 provides that permitting any person in one's employ to practice optometry, unless that person has a certificate of registration as a registered optometrist, shall constitute a misdemeanor. This language, continued the court, shows that where the person in the employ of another as an optometrist has a certificate of registration there is no violation of the statute by the employer. It is common knowledge that corporations operating department stores employ registered optometrists to examine purchasers' eyes and to prescribe glasses. We assume that the members of the general assembly possessed this knowledge. Although the optometry act has been in operation since 1919 and was amended in 1945, the legislature has not inhibited the employment of optometrists by corporations, co-partnerships or individuals who are in the business of selling eye glasses or spectacles. Referring to the case of *Silver v. Lansburgh & Brother*, 11 F. (2d) 518, the court quoted with approval as follows:

> Appellants, in the main, base their claim for injunctive relief upon the ground that optometry is a learned profession the very nature of which, they say, prohibits the practitioner thereof from any affiliation or connection with a corporation or nonoptometrist . . . The court found that optometry is a mechanical art which requires skill and a knowledge of the use of certain mechanical instruments and appliances designed to measure and record the errors and deviations from the normal found in the human eye but is not a learned profession comparable to law, medicine and theology and that, though certain standards of education are prescribed by the statute and by rules of the board created under it, optometry is not a part of medicine . . . Optometry is said by a well known writer on the subject not to be a part of medicine "either by inheritance, basic principles, development or practice" It is "an applied arm of optical science resting upon the work and discoveries of physicists and opticians through the ages down to modern times It does not treat the eye, whether in health or disease, but adapts the light waves which enter the eye, in accordance with optical principles so as to produce focused and single vision with the least abnormal exertion on the part of the eye

There is no more reason, concluded the court, to prohibit a corporation from employing licensed optometrists than there is to prohibit similar employment of accountants, architects or engineers Accordingly the decree of the lower court in favor of the defendant was reversed and the cause remanded to the trial court for further proceedings.—*L. Klein v. Rosen, 64 N. E. (2d) 225 (Ill., 1945).*

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1936 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American Journal of Clinical Pathology, Baltimore

15:419-488 (Oct.) 1945

Disseminated Granuloma Venereum. E. Palik and J. R. Schenken. —p. 419.

Intermittent Fever with Lesions Simulating Those of Hodgkin's Disease: Case Report. E. A. Gall and S. G. Page Jr.—p. 431.

*Penicillin Resistance of Staphylococcus Aureus and Its Clinical Implications. H. H. Plough.—p. 446.

Determination of Bromsulphalein in Normal, Turbid, Hemolyzed or Icteric Serums. O. H. Gaebler.—p. 452.

Sarcoma of Prostate: Report of 1 Case of Rhabdomyosarcoma of Prostate. A. E. Rappoport and C. E. Nixon.—p. 456.

*Erythroblastosis Fetalis Unrelated to Rh Factor: Report of 9 Cases Suggesting Isoimmunization of Group O Mothers by A Children. S. H. Polayes and C. Ohlbaum.—p. 467.

Rh Heterozygous Mendelian Transmission in Large Family: Case Report. I. G. Frohman.—p. 471.

Tuberculoid Reaction in Retroperitoneal Neurocytoma. P. H. Hartz and A. Van Der Sar.—p. 473.

Screening Test for Identification of Allergic States. A. G. Hulett. —p. 478.

Ammonia Poisoning and Hemolytic Anemia with Bone Marrow Heterotopia. O. J. Pollak.—p. 481.

Penicillin Resistance of Staphylococcus Aureus.—Plough reports the penicillin sensitivity of 40 strains of hemolytic Staphylococcus aureus isolated from patients in an army hospital. The sensitivity ranged from complete tolerance of 4 penicillin units per cubic centimeter to inhibition by 0.002 unit per cubic centimeter. Over 40 per cent of the strains could be called resistant. Most strains isolated from patients who had received penicillin treatment were resistant. Most strains from patients who had not received penicillin were sensitive.

Erythroblastosis Fetalis Unrelated to Rh Factor.—Polayes and Ohlbaum report 3 additional cases of erythroblastosis fetalis in which the mother belonged to blood group O and the offspring to group A, with the mother's serum showing abnormally high anti-A agglutinin titers. The authors have now studied 9 cases in which the Rh factor as well as the Hr antigen were excluded as possible immunizing agents. Two of the 9 cases terminated fatally. The 2 fatal cases showed on postmortem the classic anatomic changes of erythroblastosis fetalis. Evidence is accumulating that erythroblastosis fetalis may result from isoimmunization with the A (and B?) antigen by a mechanism similar to that already established for the Rh factor.

American J. Digestive Diseases, Fort Wayne, Ind.

12:385-402 (Dec.) 1945

Nomogram for Preparation of Insulin-Protamine Zinc Insulin Mixtures. E. M. Abrahamson.—p. 385.

*Metabolic Abnormalities in Obesity: Statistical Survey. M. A. Goldzieher, N. A. Reimer and J. W. Goldzieher.—p. 387.

Effect of Temperature on Experimental Production of Ulcers in Intestines of Dogs. R. L. Driver.—p. 394.

Inhibitory Effect of Mineral Oil on Experimental Production of Ulcers. R. L. Driver.—p. 395.

Importance of Paracolon Organisms with Salmonella and Shigella Antigens. O. Felsenfeld and Viola Mae Young.—p. 396.

Staphylococci in Gastroenterology. G. H. Chapman.—p. 399.

Metabolic Abnormalities in Obesity.—The Goldziehers and Reimer compared observations on 100 unselected cases of obesity with 100 cases of obesity clinically diagnosed as pituitary disease. It was found that the mean basal metabolic rate is lower than normal in the obese and significantly lower in pituitary obesity as well as in obese juveniles. The specific dynamic action of proteins is lower than in normal controls. A higher specific dynamic action appears in obese patients of even fat distribution and in those with regional distribution of the hypothyroid or hypogonad type. The specific dynamic action is low in pituitary obesity as well as in the juvenile group. Much higher values were obtained in the menopausal or hypogonad group. The differences observed are statistically significant. The mean of the fasting blood sugar in the obese is normal, but the distribution of the figures shows a substantial percentage in the hypoglycemic and hyperglycemic ranges. The mean blood sugar in pituitary and juvenile obesity is significantly lower. The blood uric acid is elevated in the obese. Lymphocytosis is a symptom of obesity. Lower twenty-four hour urine volume and diminished salt excretion characterize both the unselected and the pituitary type of obesity. Deviations from the normal metabolic state are so common in the obese as to assume statistical significance.

American Journal of Physiology, Baltimore

145:123-271 (Dec.) 1945. **Partial Index**

Influence of Sodium Lauryl Sulfate on Biologic Response to Gonadotropins and to Insulin. F. Bischoff.—p. 123.

Vitamin Deficiency and Overdosage and Resistance of Rats to Lowered Barometric Pressures. H. A. Charipper, E. D. Goldsmith and A. S. Gordon.—p. 130.

Number and Relative Concentrations of Protein Constituents of Canine Pancreatic Juice as Determined by Electrophoresis. Muriel Platt Munro and J. E. Thomas.—p. 140.

Effect of Sodium and Chloride Salts in Preventing Shocklike State Following Venous Occlusion of Limb in Dog. Julia Meyer, Bessie Lendrum and L. N. Katz.—p. 151.

Changes in Blood During Chronic and Acute Dehydration. D. DeBoer. —p. 154.

Increased Susceptibility of Protein Deficient Dogs to Benzene Poisoning. Tsan-Wen Li, S. Freeman, V. H. Hough and F. D. Gunn.—p. 166.

Alterations in Properties of Dog Hepatic Bile with Increasing Age of Chronic Biliary Fistula. E. M. Boyd, T. J. Earl, Shirley Jackson, Betty Palmer and Mary Stevens.—p. 186.

Age, Sex, Carbohydrate, Adrenal Cortex and Other Factors in Anoxia. S. W. Britton and R. F. Kline.—p. 190.

Survival of Nonadrenalectomized Rats in Burn Shock With and Without Adrenal Cortical Hormone Treatment. D. J. Ingle and M. H. Kiozenga.—p. 203.

Changes in Components A and B of Prothrombin in Dog Following Hepatectomy. F. L. Munro, E. R. Hart, Muriel Platt Munro and A. A. Walkling.—p. 206.

Effect of Exposure to Oxygen at High Pressure on Tonus and Respiration of Pyloric Muscle from Rabbit. B. C. Riggs.—p. 211.

Effect of Ambient Air Temperature and of Hand Temperature on Blood Flow in Hands. C. R. Spealman.—p. 218.

Fate of CO in Body During Recovery from Mild Carbon Monoxide Poisoning in Man. F. J. W. Roughton and W. S. Root.—p. 239.

Elimination of Carbon Monoxide from Human Body with Reference to Possible Conversion of CO to CO_2. C. A. Tobias, J. H. Lawrence, F. J. W. Roughton, W. S. Root and M. I. Gregersen.—p. 253.

Role of Proprioceptors in Shivering. J. F. Perkins Jr.—p. 264.

Hypertrophic Osteoarthropathy: Case Report. E. M. Kline.—p. 519.

Roentgenograms in Osteomyelitis Treated with Penicillin.—Fifty-two patients with acute hematogenous osteomyelitis were observed by Altemeier and Reinecke. At first many received less than 800,000 units of penicillin, usually with good results, but a total dose of 1,500,000 or more units administered over a period of three or more weeks has been found to be desirable. The penicillin was administered intravenously or intramuscularly in amounts of 15,000 to 25,000 units at intervals of three hours. All patients recovered except 1 with severe and neglected acute hematogenous osteomyelitis of the tibia with staphylococcic pneumonia and bacteremia who was moribund when admitted. The roentgenograms during the first four to ten days do not aid in the diagnosis of acute osteomyelitis. Later in the disease roentgenographic changes varied with the age of the patient, the severity of infection, the duration of infection before treatment with penicillin, the adequacy of therapy and the type of infecting bacteria.

Miniature Chest Fluorography.—Hauser and Dundon submit evidence of the accuracy of findings in 1,000 subjects examined by the 4 by 5 inch miniature method in comparison with the standard 14 by 17 inch film. An x-ray unit was installed in the Department of Roentgenology at the University Hospitals of Cleveland to reduce the cost entailed in examining the chests of employees who constitute an unselected, apparently healthy, adult group. The cost of the smaller film is about one-sixth that of the conventional size without consideration of the saving in processing. Miniature and large roentgenograms were simultaneously obtained on the first thousand asymptomatic subjects examined. Precision in technic in miniature fluorography and experience in the interpretation of miniature films are necessary for the highest degree of accuracy. Twenty-four minimal pulmonary tuberculous lesions were detected in 1,000 examinations. Four errors were made in the first interpretation of the miniature films. Only one error was recorded on review of both sizes of films.

Miliary Carcinosis of Lungs Secondary to Primary Gastrointestinal Cancer.—Culver presents 4 cases of miliary carcinosis of the lungs from gastrointestinal cancer and traces the pathogenesis of the pulmonary lesions. In the chest roentgenogram the lesions are evenly and diffusely distributed throughout both lung fields such as would be expected with a hematogenous spread through the pulmonary circulation. The various lesions are not of homogeneous density but appear as soft mottled areas with fuzzy, poorly defined margins. Miliary tuberculosis and silicosis must be considered in the differential diagnosis. The lack of physical findings in spite of a severe pulmonary involvement is emphasized.

Blood Plasma for Filling the Pleural Space Following Pneumonectomy.—According to Adams and his associates, chief objections to pneumonectomy without thoracoplasty have been the hazard of serious infection of the pleural space and mediastinum, ill effects produced by overexpansion of the remaining lung and lowering of the blood plasma protein and tissue protein reserve, which is partly due to the filling of the pleural space with fluid rich in proteins. The results of the control experiments on animals revealed that the total blood proteins were reduced by as much as 25 to 30 per cent of their preoperative value. Replacement therapy in the form of blood or serum given intravenously, or serum intrapleurally, was quite effective in reducing the blood protein fall after pulmonary resection. Both methods of administration appeared to be effective. Blood protein determinations made by the micro-Kjeldahl method and hematocrit values were obtained before and at two day intervals for a ten to fourteen day period after thirty-two major operations, including fourteen lobectomies, five pneumonectomies, seven exploratory thoracotomies and six miscellaneous operations. The authors tested the influence of filling the pleural space with plasma following total pneumonectomy in man. They report results obtained on 18 patients receiving such treatment and on 10 additional patients used as controls without use of plasma. The incidence of complications following operation, including empyema, bronchial fistula, bronchitis, atelectasis and pneumonia, was much less in the group of patients whose pleural space was filled with plasma, being approximately 50 per cent of that of the control group.

Penicillin in Acute Hematogenous Osteomyelitis in Children.—Compere and his associates report 12 cases of acute hematogenous osteomyelitis controlled by penicillin or by a combination of penicillin and sulfonamides. Surgery was necessary in 4: in 1 for the removal of a small sequestrum and in 3 for the drainage of an abscess after the acute infection had subsided. Penicillin appears to be more effective in acute hematogenous osteomyelitis than any other therapeutic agent. Early use of penicillin in adequate doses administered at frequent intervals may not only cure the initial infection but prevent spread to other bones and in a majority of cases makes surgery unnecessary. If the penicillin is not started until after a bone has been extensively damaged, late surgery may become necessary. After the temperature begins to subside, the size of each dose of penicillin may be reduced, but the frequency of dosage must be maintained When the patient becomes afebrile the dosage may be reduced gradually and discontinued after five days of normal temperature. Recurrences may occur if penicillin is stopped too soon. In several cases there was a small, secondary temperature rise after the penicillin was stopped. It is important not to neglect well established principles of medical care, such as the maintenance of the fluid balance of the body through the administration of isotonic solution of sodium chloride, dextrose, plasma or blood Splints, plaster encasements or traction should be used when they are needed for supporting the diseased bone or to prevent contractures

Vagotomy for Gastroduodenal Ulcer.—Dragstedt says that the chief secretory abnormality in ulcer patients is the secretion of abnormally large amounts of gastric juice in the intervals between meals, particularly at night when the stomach is empty. Evidence has been obtained which suggests that hypersecretion of gastric juice by ulcer patients is neurogenic in origin. Animal experiments had revealed that section of the vagus nerves to the stomach greatly reduced the secretion of gastric juice. Vagus section has been performed on 39 patients. The vagus nerves of the stomach were divided in 30 patients with duodenal, in 2 with gastric and in 7 with gastrojejunal ulcers A striking and persistent relief of ulcer distress has been almost uniformly secured, with gain in weight and x-ray evidence of healing of the lesions. Section of the vagus nerves had no effect on the secretory response of the stomach to histamine or caffeine but abolished the response to insulin hypoglycemia and a sham meal The tonus and motility of the stomach were decreased but not abolished.

Late Onset of Symptoms in Multiple Sclerosis.—Friedman and Davison found that in 310 patients with multiple sclerosis admitted to the Montefiore Hospital the onset of symptoms after the age of 40 occurred in 41 (13 per cent). Of 42 patients with multiple sclerosis on whom autopsy studies were made at this hospital, the disease began in 9 (21 per cent) during or after the fifth decade of life. The case histories of these 9 patients were investigated in order to determine whether the symptoms and clinical course of the patients with a late onset of symptoms differs from that of patients with an onset early in life The diagnostic criteria of multiple sclerosis in the later years of life differ from those of the younger age group by showing a tendency to a progressive course, clearer evidence of intellectual deterioration and less evidence of dissemination of lesions.

Changes in Cerebral Veins in Hypertension.—Scheinker studied 65 typical cases of hypertension associated with massive cerebral hemorrhage In most of these cases two types of lesions were observed: (1) reversible changes, manifested by venous congestion and stasis, resulting in tremendous distention, and (2) structural alterations of the vessel wall, characterized by an extreme degree of atrophy and advanced signs of degeneration and necrosis Attention is directed to the predominantly venous origin of cerebral hemorrhage, which is considered as a terminal phase in a sequence of events which begin with reversible vascular disturbances. In a later stage structural alteration of the cerebral veins occurs, and terminal degeneration and necrosis of the vessel wall are present. In the presence of far advanced venular atrophy, elevation of venous pressure would appear to be an essential precursor to the massive escape of blood.

*Loeffler's Syndrome: Report of Case, with Pathologic Examination of Lungs E C. Bayley. D. O N Lindberg and A. H. Baggenstoss.—p 376

Bone Marrow and Folic Acid Deficiency.—Endicott and his associates found that leukopenia, granulocytopenia and, less frequently, anemia develop in rats given succinylsulfathiazole in purified diets, and that the Lactobacillus casei factor (folic acid, or vitamin B_c) corrects or prevents these dyscrasias. The involved marrow is hypocellular and shows general depletion, especially of the myeloid series. The erythroid series is usually depleted even though anemia may not be found. The response of the marrow to folic acid is a rapid regeneration with spectacular myeloid proliferation When anemia is also present the erythroid series becomes hyperplastic and later is crowded out by myeloid hyperplasia. The marrow returns to normal after temporary overcompensation. From the pathologist's point of view the chief importance of experimental granulocytopenia and agranulocytosis and anemia of this type lies in its unique adaptability to research.

Loeffler Syndrome.—Bayley and his associates report the results of the postmortem examination of a woman aged 59 who died of Loeffler's syndrome. The examination was limited to the study of the lung. The bronchial lesions were similar to those observed in bronchial asthma. The predominantly eosinophilic exudate infiltrating all portions of the wall, the hyalinization and thickening of the basement membrane of the epithelium and the presence of large quantities of mucus in the cells and lumens were all typical of bronchial asthma The advanced organization of the pneumonic exudate and the granulomatous character of the focal lesions constitute overwhelming evidence that the pulmonary lesions are not "transitory" in all cases The most *striking vascular change* was that of necrotizing arteritis and arteriolitis, *which histologically* appeared quite similar to the change observed *in periarteritis* nodosa It also suggests that there is an underlying allergic basis in Loeffler's syndrome

Vitamin D in Milk of Women Fed Fish *Liver Oil.*—Polskin and his co-workers determined the vitamin D content of human milk following *the ingestion of fish oils* containing the antirachitic *vitamin* Vitamin D *in the form of* mixed fish liver oil was supplied in a single dose of 32,000 U. S. P. XI units by capsule at each weekly visit. A total of 59 patients were studied in all, 21 of whom served as controls and received no vitamin D supplement. The vitamin D level in the milks of 18 of the controls was inappreciable, ranging from traces to less than 10 international units per quart. Three women showed values of 17, 28 and 40 international units per quart. The average vitamin D content per quart of milk of mothers supplied during the latter half of pregnancy was 10 international units for 7 mothers given from 32,000 to 96,000 international units of supplement, 53 international units for 9 mothers given from 128,000 to 224,000 international units of supplement, 62 international units for 5 mothers given from 256,000 to 320,000 international units of supplement and 53 international units for 6 mothers given from 416,000 to 480,000 international units of supplement. Two mothers given a single dose of 32,000 international units during labor secreted milks from three to eight days later which bioassayed 91 and 216 international units per quart. Seven women given 40,000 international units of vitamin D daily from labor to about ten days later yielded milk the vitamin D content of which averaged 310 international units per quart. For the purpose of fortifying human milk with vitamin D for infant use, supplementation of the mother with fish liver oil during pregnancy is not a practical method. Vitamin D must be taken just prior to or during lactation in order to enrich the milk with the factor appreciably.

Penicillin in Pneumococcic Meningitis in Infants.—Hutchins and Davies report 14 cases of pneumococcic meningitis in children under 2 years of age treated with penicillin. In 7 some form of sulfonamide had been administered at various intervals before hospitalization. A number of the children were given sulfadiazine during hospitalization either for complications or for reasons associated with meningitis. The earlier patients and smaller infants were given penicillin intramuscularly on a dosage schedule of 3,000 units every three hours. The other patients were given 5,000 units every three hours. The schedule of intrathecal therapy was 10,000 units twice a day (or three times a day for the first few days) in an aqueous or saline solution containing 1,000 units per cubic centimeter. When blocks occurred so that spinal fluid could not be obtained by the lumbar route, penicillin was given intracisternally when possible and intraventricularly in a few cases. Penicillin was administered by the intrathecal route for an average of eleven days. Recoveries, either intact or with residual damage to the brain, were significantly more frequent than with sulfonamides and type specific antiserum. Of 14 infants, 9 survived.

Prevention of Rheumatic Recurrences by Use of Sulfonamides.—Wolf and his associates state that a group of 70 children receiving sulfathiazole or sulfadiazine for a total of 81 patient seasons did not have recurrences of rheumatic fever during the periods of treatment. One child developed a recurrence during a summer season between courses, and another developed subacute bacterial endocarditis during the same period. A third child developed subacute bacterial endocarditis while being treated. Albuminuria occurred in 9 patients receiving sulfadiazine, which in 4 instances was so severe that the drug was withdrawn. Mild leukopenia occurred in 4 patients, 2 receiving sulfadiazine and 2 sulfathiazole, but the number of white cells quickly returned to normal when the drug was withdrawn for a few days. The prophylactic treatment with sulfonamides should be continued throughout the year. In many cases it would seem advisable to administer the drug continuously for several years.

Aneurysm of Subclavian Artery in Infant: Report of Case. R. A. Daniel Jr.—p. 487.

Traumatic Wet Lung.—As members of thoracic surgical teams, Burford and Burbank treated 1,500 patients with thoracic trauma. They call attention to the fact that in wounds of the chest the lung tissue reacts to produce more than the normal amount of interstitial and intra-alveolar fluid. The bronchopulmonary tree has more fluid to remove but is less capable of doing so. The result of these two phenomena is what may be called the "wet lung" of trauma. Failure to take cognizance of this fact will frequently lead to death or to the establishment of chronic pulmonary invalidism. The patient with early wet lung is apprehensive. Dyspnea is present and is accompanied by paroxysms of a painful cough which is not effective in emptying the bronchopulmonary segments. There is restriction of motion of the involved side. The most striking feature is the presence of rales, which are bronchial in character and consist of wheezes and rhonchi. Therapy must control the production of moisture and promote adequate bronchial drainage. Pain, which interferes with an effective cough mechanism, must be combated. Adhesive strapping and the use of morphine are physiologically unsound and ineffectual. The authors have used procaine either at the site of injury, by intercostal nerve injection or by thoracic paravertebral sympathetic nerve block, with gratifying results. The cough becomes painless and effective. The patient will often pass from an alarming state to one of comparative comfort and safety within a few minutes. Some of these patients will require mechanical evacuation of the bronchial tree. Some will present evidence of persistent moisture after nerve block and aspiration. For these the administration of atropine may be of value.

Penicillin Therapy in Hemolytic Staphylococcus Aureus Bacteremia.—Five days after being wounded in the right chest, a man was found to have a serrated missile, measuring 3 by 4 cm., lying in the right pleural cavity, a moderate degree of pathologic change within the lungs and clotted hemothorax. During the subsequent five days the intrapulmonary lesions cleared to a considerable extent and a right posterolateral thoracotomy was done. The intrapleural foreign body was removed and the organizing clot evacuated. Seven days after operation the temperature rose and the patient complained of pain in the wound, which was somewhat indurated. On the following day hemolytic Staphylococcus aureus was found and subsequently suppuration appeared, which was drained. Later, when a blood culture revealed hemolytic Staph. aureus, treatment with sodium sulfathiazole was started, but infected emboli appeared in the extremities. Sulfathiazole therapy was stopped and treatment with penicillin was begun. Burford and his associates state that the response to penicillin was dramatic and conclusive. Of particular significance was the recrudescence of the infection with the temporary cessation of penicillin therapy and the prompt regression of signs and symptoms on the resumption of the agent.

Solid Blast Injury.—Barr and his associates studied 50 cases of solid blast injury of sufficient severity to require evacuation to naval hospitals in the United States. This injury is a definite clinical entity caused by the shock wave from an explosion transmitted through solid material, usually steel, to personnel in contact with this material. In the typical case there are fractures of the lower extremities, with extensive soft tissue damage. Fractures of the os calcis occurred in 15 instances. There were 15 fractures involving the astragalus, and in each case there were associated fractures of contiguous bones. Fractures of the distal tibia occurred in 20 instances, 10 of them compound. Injuries involving the ankle and the tarsal bones occurred in 18 of the 50 cases and are the most common and characteristic among the solid blast injuries. Fractures of the shaft of the tibia and fibula occurred 9 times (4 compound). Fractures of the upper end of the tibia involving the knee joint occurred 14 times (2 bilateral). Ten legs were amputated soon after injury because of gangrene subsequent to irreversible damage to the circulation. In 4 cases the amputation was bilateral. In the majority of these cases the popliteal artery had been torn by dislocation of the knee joint, with or without fracture. These patients all received satisfactory first aid treatment. Proper early surgical management and late reconstructive procedures will restore the majority of the limbs to useful function.

*Immersion as a Factor in Development of Hypertension. O. Garai.—p. 200.

Intolerance to Mercurial Diuretics.—Burrows and Stokes report 9 cases of skin reactions to mercurial diuretics, in 1 of which a severe reaction was accompanied by manifestations of an acute nephritic nature and by stomatitis. The other 8 in which mercurial diuretics were administered gave only the skin signs. Sensitization, idiosyncrasy or allergy may be of different degrees. Skin rashes and itching without other complications seem to indicate moderate sensitivity. There appears to be a threshold concentration of mercury in the blood above which signs of allergy develop, and this may vary with the individual patient. An injection of a mercurial diuretic did not cause a rash when a patch test immediately preceding it was negative. Accordingly this test should be useful when accumulation of the drug is suspected or when continuation of treatment is desirable after cutaneous sensitization. Sensitivity, as shown by patch testing, may be lost after a brief period of rest from the drug. Cutaneous sensitization to mercury need therefore not contraindicate the subsequent employment of these diuretics in adjusted dosage after a short interval.

Effects of Emetine on the Heart.—Cottrell and Hayward found that diminution or inversion of the T waves occurred in one or more leads in 25 out of 32 cases of amebiasis in which emetine was employed. In 12 cases there was an increase in the PR interval of from 0.02 to 0.04 second. Similar changes occurred during treatment with bismuth iodide, 7 out of 8 cases showing diminution in T waves and prolongation of the PR interval. The cardiogram returned to normal from eight to twelve days after the completion of treatment. The effect on the blood pressure and pulse rate of both drugs was insignificant, and there was no clinical evidence of myocardial insufficiency.

The Carotid Shudder.—In 9 patients in whom subsequent clinical, cardiographic and cardioscopic examination established the presence of aortic stenosis and incompetence Evans and Lewes observed a characteristic sign which permitted a diagnosis of the combined aortic lesion from inspection of the neck. At the height of the carotid pulse, large on account of aortic incompetence, they noticed a quiver or vibration which lasted for only a moment. This effect they have named the "carotid shudder." Only a proportion of patients with combined aortic stenosis and aortic incompetence exhibit carotid shudder, but the fact that they were able to observe 9 such cases in eighteen months emphasizes its common occurrence. The clinical sign was not present in patients in whom aortic incompetence or aortic stenosis existed separately.

Immersion as Factor in Hypertension.—Garai studied a group of 15 physically fit men of the merchant navy, all of whom had been shipwrecked and exposed to cold and immersion. To act as controls, a group of nonimmersed neurotic men and a group of nonimmersed non-neurotic men were also tested in the same manner. The response of shipwrecked men to a standard "cold pressor test" (immersion of the hand in ice water and determination of blood pressure changes) was different from that of the two control groups, who had not been exposed to wet and cold. The author concludes that this tends to support the hypothesis that exposure if severe and prolonged can have a damaging effect on the normal kidney.

Blindness Following Hematemesis. J. Black.—p. 920.

Congenital Obliteration of Bile Ducts and Icterus Gravis Neonatorum.—During the past three years Skelton and Tovey have observed several cases of hemolytic disease of the newborn in which there have been either clinical signs simulating congenital obliteration of the bile ducts or a history of this condition in other members of the family. They conclude that certain cases of so-called congenital obliteration of the bile ducts occur as sequels of icterus gravis neonatorum.

Rh Negative Patients Transfused with Positive Blood.—Moloney reports Rh studies on 138 wounded American soldiers transfused with whole blood at the 163d General Hospital. Of this group 18 were found to be Rh negative; they were investigated for the presence of Rh antibodies and also in regard to the survival of Rh positive cells in the circulation. There was evidence of abnormally rapid elimination of transfused Rh positive red cells from the circulation of some Rh negative recipients. While demonstrable antibodies were found in only 1 case, it is quite possible that isoimmunization and latent sensitization occurred in others of this group. The mechanism of rapid loss of Rh positive red cells from Rh negative recipients is obscure. Various extrinsic factors may have influenced this phenomenon, or some undetected antibody may play a part in this hemolytic process. The possibility that an activated reticuloendothelial system (or other cellular agency) may be involved in the rapid elimination of Rh positive cells deserves further study. From the practical standpoint, Rh negative persons should be transfused with Rh negative blood. While Rh isoimmunization may present few serious immediate reactions, the possibility of Rh sensitization should be avoided.

New Synthetic Estrogen.—The new synthetic estrogen discussed by Greene and designated as D. B. E. is the proestrogen α α-di-(p-ethoxyphenyl)-β-phenyl bromoethylene. It differs from estradiol and stilbestrol in that a small increase in the dose produces a great prolongation of action. It appears, therefore, that D. B. E. is stored in the body and slowly released. Greene investigated the efficacy of this substance in menopausal women, in men with carcinoma of the prostate and in patients with uterine atrophy. The only advantage of the drug seems to be its prolonged action. In some respects it is inferior to the other synthetic estrogens, and the author doubts that the advantage of weekly over more frequent administration of other estrogens is sufficient to warrant the general introduction of the new estrogen.

Comparative Effect of Sulfonamide and Penicillin in Pneumonia.—A series of 126 patients over the age of 35 who had pneumonia were divided into two groups, one receiving sulfathiazole and the other penicillin. All patients received the same symptomatic treatment and general clinical control. Each method achieved fairly similar results. Anderson and Ferguson think that properly controlled sulfonamide treatment for the average case should not be discarded and suggest that penicillin should be used for selected patients, usually in combination with a sulfonamide. A poor cardiovascular system is an indication for combined therapy. Extensive pulmonary involvement, severe cyanosis and dyspnea are other indications which may call for the support of chemotherapy with penicillin.

Penicillin in Serous Cavity Infections.—McAdam and his associates determined the levels of penicillin in the various body fluids following penicillin administration by different routes and different methods. The fluids examined included blood serum, pleural, pericardial, peritoneal, synovial and cerebrospinal fluids and pus from abscess cavities. The penicillin content of the fluids was approximately evaluated from a consideration of the dilution of the fluid which completely inhibited the growth of the standard staphylococcus. It was found that, provided the dosage is sufficiently high, systemic administration of penicillin produces adequate bacteriostatic levels in the exudates of infected body cavities, infected cerebrospinal fluid and abscess pus. The dosage of penicillin required to obtain an adequate bacteriostatic level in these exudates appears to be somewhat higher than that necessary for adequate serum bacteriostasis. Penicillin administered locally cannot be relied on to reach all sites of infection because of the pronounced tendency for loculation to occur in infections of serous cavities. Local administration of penicillin is therefore not a substitute for systemic administration, but it may be of some advantage because of the high bacteriostatic levels produced in the exudates. After local administration of penicillin into the peritoneum, a joint and the cerebrospinal fluid, the authors have obtained adequate bacteriostatic levels in the serum for from eight to eighteen hours.

Epidemic of Diarrhea Caused by New Strain of Salmonella Group. A. A. Ferris and R. Hertzberg.—p. 368.

Patent Ductus Arteriosus.—Of 14 patients operated on for patent ductus arteriosus 4 succumbed to operation, 2 from hemorrhage and 2 from other causes. One died from subsequent infective endocarditis. The patients successfully operated on have been followed up for periods varying from two to twenty-one months, and the results are uniformly good. As indications for surgical treatment Shallard lists (1) subacute bacterial endarteritis or endocarditis, (2) cardiac insufficiency and cardiac hypertrophy, (3) mental and physical retardation.

Polyposis of Large Intestine.—Leveuf and his associates report a case of familial, adenomatous, disseminated polyposis of the large intestine. A youth aged 18 had diarrhea and bloody discharge since the age of 11. At 17 the diarrhea and bleeding became profuse. There was considerable loss of weight. The father of the patient died from cancer of the rectosigmoid at 36, an uncle died from cancer of the splenic flexure at 32, the grandfather died from cancer of the liver at 46 and a great uncle died from an intestinal tumor at 30. The existence of adenomatous polyposis was not demonstrated in any of these cases. The patient was treated with irrigations of magnesium chloride through a cecostomy and orally. His general condition improved, but the polyps did not disappear. Colectomy was performed in two stages. The distal portion of the sigmoid and the rectum were conserved, and coagulation of the polyps was continued. The patient gained weight rapidly and returned to work. Roentgen therapy of adenomatous polyposis is uncertain and dangerous. Surgical treatment is recommended for the removal of the involved portion of the bowel for the prevention of the development of cancer, of intestinal obstruction, of hemorrhage and of ulcerative colitis. Subtotal colectomy, following low ileosigmoidostomy, and conservation of the rectum and its sphincter constitute the method of choice.

Bilateral Lumbar Sympathectomy by Extraperitoneal Median Route. J. Kunlin.—p. 597.

Age and Antidiphtheritic Vaccination.—Age is of primary importance in the interpretation of statistics concerning vaccination against diphtheria. The incidence of diphtheria is on an average four times higher among children of preschool age than among those attending school. Vaccination is practiced more often among school children than among those not attending school. The average age of children in Paris who have not been vaccinated is 5 years, whereas the average age of the vaccinated is 8 years in spite of the fact that antidiphtheritic vaccination is obligatory in France. Paris hospital statistics show that diphtheria is two to three times more often fatal in children during the first six years of life than in those between the ages of 6 to 14 years. Paris hospital statistics published in 1944 showed a 7.1 per cent fatality rate among the vaccinated and a 9 per cent rate among the nonvaccinated children, but the age of the nonvaccinated was considerably lower than that of the vaccinated. Rendu concludes that the incidence of diphtheria is much lower and the disease is less severe among the vaccinated children as compared with the nonvaccinated. This fact depends on the difference in age of the two groups rather than on the effect of vaccination. Valid conclusions cannot be drawn from statistics in which the vaccinated persons are compared to the nonvaccinated whose average age is not the same.

Lobstein's Disease, Hereditary Syphilis and Rickets. F. Masselot and Arrighi.—p. 639.

Arterial Lesions of Silicotic Blocks.—Necropsies on miners who die of silicosis frequently reveal the existence of "blocks," hard fibrous masses occupying all or part of a pulmonary lobe. Microscopic examination of these lesions has shown considerable alteration in the arterioles which irrigate these lobes. Under the microscope the blocks appear practically avascular, but the vascular changes can be demonstrated by postmortem arteriopneumography. Croizier and his associates explain that after the lungs have been removed the pulmonary artery is injected with diluted barium oxide and the specimen is examined by x-ray, so that the vascular involvement of the silicotic blocks is put in evidence in its entirety. There exists from the onset a perivascular fibrous casing which encloses equally lymphatics, veins and pulmonary bronchi. The arteries are the elements that resist the longest. The most serious vascular lesions are in the region of the silicotic blocks. There is obliteration by thrombosis, with thickening of the intima and changes caused by distention of the elastic elements. The lesions terminate in total disintegration in a mass of sclerotic tissue. The role of tuberculosis in this process is debatable. While there is evidence that it is of importance, it is not always present. The vascular lesions appear early, and it is probable that the arterial involvement, associated with venous, lymphatic and bronchial lesions, is an important factor in the rapid evolution of the pneumonoconioses of miners.

Antidiphtheritic Staphyline.—Duliscouet reports experiments in vitro and in guinea pigs which demonstrate that the antagonistic or active strains of staphylococci produce a lysogenic substance which prevents the growth of the Loeffler bacillus. The antagonistic effect of this substance is identical with that of the strain by which it is produced. This effect is manifested on growth of the diphtheria bacillus; the action of the diphtheritic toxin is not influenced. Two stages are to be considered in the development of this antagonism: The first is the preparatory stage during which the active staphylococcus assimilates the culture medium and multiplies. This multiplication ends in the formation of a specific, active, bacteriolytic principle.

*New Therapeutic Application: Intravenous Procaine Hydrochloride; Surgical Aspect of This Drug. A. Berthelemy.—p. 413.
Cryptoleukemia with Clinical Course of Pseudocirrhosis: Brutal Onset with Symptoms Simulating Appendicitis. B. Muller.—p. 415.

Intravenous Procaine Hydrochloride in Surgery.—Berthelemy reports the results of intravenous injections of procaine hydrochloride in 80 cases of frostbite of the foot in the French army during the winter campaign of 1944. Seventy-five of the cases were mild, while the remaining 5 were considered grave. In the 5 grave and in 15 mild cases the injection was made into the femoral artery. The remaining 60 soldiers were given an intravenous injection of 20 cc. of a 1 per cent solution. Patients who suffered extremely were given another injection the same night and almost all of them slept. Sixty patients were able to walk the second day after admission, and three days later 70 patients returned to the front line. Only 5 patients in addition to the 5 with grave frostbite were evacuated to a base hospital. Both intra-arterial and intravenous injections appeared effective, but the effect of the intravenous injections seemed to be more satisfactory. An intravenous injection proved effective after the failure of an intra-arterial injection. Intravenous procaine hydrochloride was used also in the treatment of hundreds of indolent wounds with torpid cicatrization. Complete cicatrization occurred within twenty days to one month of the start of the treatment. Intravenous injections proved superior to the intracutaneous or subcutaneous infiltration of the area adjacent to the wound. Three daily intravenous injections were made in many cases of tibiotarsal sprain, and the results were as satisfactory as those with local infiltration and there was less pain. Good results were obtained in several cases of dislocation of the shoulder, the elbow and the fingers after reduction was accomplished. Function was restored rapidly. In fractures with slight displacement, e. g. fractures of the tuberosity of the humerus and in fractures of the wrist, the injections were continued daily for ten days. Painless mobilization became possible within twenty-four hours of the first intravenous injection. Union occurred rapidly and without complications. The results from this treatment in arthritis, hydrarthrosis and for pain of gastric ulcer were encouraging.

*Use of Cellophane for Prostheses of Tympanic Membrane. E. P. Steinmann.—p. 647.
Sterility by Functional Alteration of Ovary. P. Dubuis.—p. 653.

Cellophane Prostheses of Tympanic Membrane.—Steinmann has applied cellophane prostheses to about forty tympanic membranes. The artificial tympanic membranes adhere for several weeks, usually without irritation in the middle ear. In only 1 case did a mucopurulent secretion develop, which caused flushing out of the prosthesis. The normal desquamation of the tympanic membrane usually causes the prosthesis to slide backward after a few weeks. In the case of new and particularly traumatic perforations, this period is sufficient to permit their closure. In older perforations, granulations likewise appear at the edge of the defect, but this zone of new growth is highly sensitive and complete closure is usually accomplished only after repeated attachments of artificial tympanic membranes. The improvement in the hearing capacity effected by the cellophane prosthesis is considerable.

*Rare Constitutional Abnormality of Blood in Relation to Hereditary Microcytic Anemia. E. Silvestroni and I. Bianco.—p. 137.

Constitutional Microcytic Anemia. — Silvestroni and Bianco examined the blood of 1,000 normal persons living in different zones of Italy. An abnormality consisting of an increased number of the erythrocytes, diminished hemoglobin, microcytosis and increased resistance was found in 88 persons. Morphologic changes in the erythrocytes and hyperhemolysis were sometimes present. The leukocytes and platelets were normal. The skin was pale or subicteric. There was moderate splenomegaly. The abnormality is transmitted according to mendelian law. It is more frequent in Sicily and Sardinia than in other parts of Italy. The authors believe that this form of constitutional microcytic anemia is different from the classic form of hemolytic jaundice since anemia and microcytosis are the predominant features and heredity is an indispensable factor for its development.

Case of Incarcerated Diaphragmatic Hernia. S. Neij.—p. 2703.

Examinations of Sternal Marrow in Nephrogenic Anemias.—Faarup and Ohlsen tabulate results of 21 sternal punctures in 19 cases, 12 of chronic glomerulonephritis or nephrosclerosis, 1 of subacute glomerulonephritis, 5 of pyelonephritis and 1 of interstitial nephritis. They conclude that in cases of anemia with renal insufficiency due to chronic glomerulonephritis or nephrosclerosis the anemia depends on a hypoplastic, or in some instances on an aplastic erythropoiesis, which explains the failure of the usual antianemic remedies. In these cases it is essential to counteract the azotemic condition first.

Advances in War Surgery During Present War. Einar Perman.—p. 472.

Early Diagnosis of Pulmonary Cancer.—Wandall says that histologic verification of the diagnosis of pulmonary cancer by bronchoscopic biopsy can be anticipated in about half of the cases. Puncture of the lung by aspiration biopsy, thoracoscopic biopsy, establishment of tumor cells in the pleural exudate and demonstration of tumor cells in the expectorate are available methods. The last named procedure allows definite establishment of tumor elements in about four fifths of the cases of primary pulmonary cancer. The specimen must be from the bronchi and not be allowed to stand more than eight hours. By application of bronchoscopic biopsy and examination of the expectorate the diagnosis of cancer of the lungs can be verified in about 90 per cent of the cases. Sometimes exploratory thoracotomy will be necessary. All patients over 35-40 should be thoroughly examined if cough, expectoration or lowered general condition continues after pneumonia, influenza or severe febrile colds, if these disorders recur or if there are hemoptysis, attacks of atypical pain in the upper part of the abdomen, thorax, shoulder and arm. The fact that pulmonary cancer can be cured if treatment is given in time and that young persons are often affected calls for bending every effort for thorough examination of these patients as soon as symptoms appear.

Book Notices

A Future for Preventive Medicine. By Edward J. Stieglitz, M.S., M.D., F.A.C.P. Studies of The New York Academy of Medicine Committee on Medicine and the Changing Order. Cloth. Price, $1. Pp. 77, with 7 illustrations. New York: Commonwealth Fund; London: Oxford University Press, 1945.

Seldom does one find the wealth of wisdom, philosophy and factual information within the pages of a single volume. This monograph will challenge the imagination and hold the concentrated attention of the reader from beginning to end. That the problems of the future will not lend themselves with increasing benefits to systems for the mass treatment and control of disease is the strong conviction of the author. The individual cannot be "given" health. He must recognize its value and consciously strive to achieve a high standard through education and knowledge derived from research. Government may make the facilities available, but that in itself is not enough—the interest and will of the individual are highly essential to the success of a health program. Health in its fullest sense is not a right that can be demanded. It must be sought for and deserved through conscious intelligent individual effort. Dr. Stieglitz pulls no punches nor does he mince words. He leaves no doubt as to his attitude toward some of the health and medical problems of the present day. Among others the significance and value of the health inventory is set forth with a clarity and emphasis that is new and refreshing. Not every one will agree with everything that Dr. Stieglitz says, but the provocative statements will cause serious thought and result in wholesome discussion.

The Physician's Business: *Practical and Economic Aspects of Medicine.* By George D. Wolf, M.D., Assistant Clinical Professor of Otolaryngology, New York Medical College, New York. With a foreword by Harold Rypins A.B., M.D., F.A.C.P. Second edition. Fabrikoid. Price, $6. Pp. 433, with 58 illustrations. Philadelphia, London & Montreal: J. B. Lippincott Company, 1945.

This is a revision of the original volume, which first appeared in 1938. Added are chapters on prepayment health (or sickness) insurance and workmen's compensation laws. Both are well done. However, the former is already somewhat out of date because of the rapid changes taking place and recent actions of organized medicine. As the author points out, the chapter on medical careers other than private practice is somewhat obsolete, having been written before the war. This is equally true of portions of the chapters on specialization and on location. It might have been well, therefore, to withhold publication of the second edition until conditions had become more settled. Especially informative and helpful are the chapters dealing with case histories, planning and equipping an office, office personnel, technics and surgical instruments. It is quite evident that the author is much better equipped to write on these subjects than on business procedures. The chapter dealing with financial records is incomplete and could also stand revision. That portion of the chapter on the doctor and his patient relating to financial records might well be combined with that on the income tax. The desirability of some of the procedures outlined in collecting doctors' accounts might also be open to question. On the whole, however, the author has done a thorough job. The title of the book does not by any means indicate its scope. Better is its subtitle, "Practical and Economic Aspects of Medicine."

Recent Advances in Obstetrics and Gynæcology. By Aleck W. Bourne, M.A., M.B., B.Ch., Obstetric Surgeon to St. Mary's Hospital, London, and Leslie H. Williams, M.D., M.S., F.R.C.S., Obstetric Surgeon to Out-Patients, St Mary's Hospital, London. Sixth edition. Fabrikoid. Price, $5.50. Pp. 357, with 77 illustrations. Philadelphia: Blakiston Company, 1945.

This is the sixth edition to appear since 1926. As in previous editions, the authors have selected special subjects in which there have been definite advances in our knowledge. In this edition the topics selected are (1) nutrition in pregnancy and fetal development, (2) vitamin K and hemorrhagic disease of the newborn, (3) anesthesia and analgesia in obstetrics, (4) breech deliveries, (5) erythroblastosis, (6) postnatal care, (7) stillbirth and neonatal death, (8) radiology in obstetrics (by E. Rohan Williams), (9) cancer of the uterus, (10) sterility, (11) leukorrhea, (12) sympathectomy, (13) the sex hormones, (14) ovarian tumors (by Wilfred Shaw), (15) radiologic investigation and diagnosis in gynecology (by E. Rohan Williams) and (16) x-ray therapy in gynecology (by W. M. Levitt). For each subject the authors have carefully read and interpreted the literature. In addition they offer their personal criticism and suggestions. At the end of each chapter is a list of references. It is unfortunate that the authors devoted three of the sixteen chapters, or almost one fifth of the entire book (sixty-two pages) to radiology. They might have devoted some of this space to obstetric uterine hemorrhages, puerperal sepsis and its modern treatment, gynecologic operative technic and pelvic infections, particularly the newer therapy of gonorrhea. In spite of this shortcoming the book should prove useful to practitioners who cannot keep pace with the progress which is made in obstetrics and gynecology by reading original papers. The book is well written and is adequately illustrated. In spite of the critical paper situation and the shortage of skilled printers in England, the publishers have done their part most creditably.

Carbon Monoxide: Its Hazards and the Mechanism of Its Action. By W. F. von Oettingen, Principal Industrial Toxicologist, United States Public Health Service. Federal Security Agency, United States Public Health Service, *Public Health Bulletin No. 290.* From the Industrial Hygiene Research Laboratory, National Institute of Health. Prepared by direction of the Surgeon General. Paper. Price, 35 cents. Pp. 257, with 26 illustrations. Washington, D. C.: Supt. of Doc., Government Printing Office, 1944.

Deaths from carbon monoxide still continue to occur far beyond any reasonable warrant. Some of these deaths are suicidal; others are the results of defects in the mechanism of exhausts in engines of many kinds, particularly exhausts of motor cars. This monograph by a distinguished toxicologist of the U. S. Public Health Service is the most complete work on the subject yet made available, covering completely the sources of exposure to carbon monoxide, its chemistry, methods of determination of its presence, the pathology, the clinical symptoms, the prophylaxis and the treatment. The monograph is supplemented with a bibliography and an author and subject index.

***Manual for Coding Causes of Illness According to a Diagnosis Code for* Tabulating Morbidity Statistics.** Prepared by Direction of the Surgeon General in the Division of Public Health Methods, U. S. Public Health Service, with the Cooperation and Assistance of the Division of Vital Statistics, U. S. Bureau of the Census, the Johns Hopkins Hospital and School of Hygiene and Public Health, and the Mayo Clinic. Federal Security Agency, U. S. Public Health Service, Miscellaneous Publication No. 32. Cloth. Price, $1.25. Pp. 489. Washington, D. C.: Government Printing Office, 1944.

This manual has been devised to facilitate the statistical tabulation and analysis of the causes for morbidity. It does not conflict with any nomenclature of disease and should not be used to classify causes of disease except for statistical purposes. If properly used and modified by experience this manual should serve to promote statistical handling of causes of illness and to bridge the gap between detailed clinical diagnoses and the causes of death as given in the officially adopted International List.

Statistical Methods Applied to Experiments in Agriculture and Biology. By George W. Snedecor, *Director of Statistical Laboratory of Iowa State College, Ames, Iowa.* Fourth edition. Cloth. Price, $1.50. Pp. 485, with illustrations. Ames, Iowa: Collegiate Press, Inc., 1946.

Previous editions of this book on statistical methods have been reviewed in The Journal. The latest edition, coming six years after the third, contains a great deal of valuable information for those who are interested in statistical methodology. The text has been largely rewritten. It is not simple reading for any one who is not thoroughly familiar with mathematics and the science of statistics.

Diary of the Ship's Surgeon: Being the Diary of a Ship's Surgeon on a Voyage to the Orient Just Before Pearl Harbor. By R. G. Ehlers, M.D. Cloth. Price, $1.50. Pp. 182, with 1 portrait. Boston: Meador Publishing Company, 1944.

This little book is the diary of a surgeon serving on a Merchant Marine ship just before the entry of this country into the war. It has little medical significance but furnishes pleasant reading, although throwing a depressing light on certain aspects of our prewar Merchant Marine Service and its personnel.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

SODIUM BALANCE IN EDEMA

To the Editor:—Could you explain to me the mechanism of "tissue retention of sodium" in an edematous patient? In view of the fact that the sodium ion can freely permeate the capillary endothelium, how can the tissues retain enough sodium to promote edema? In other words, why doesn't the sodium enter the capillary instead of the fluid leaving the capillary?

Frank De Trana, M.D., Chicago.

ANSWER.—The capillary wall is freely permeable to sodium in either direction, and edema is not due to a change in this permeability. Therefore the phrase "tissue retention of sodium" must not be taken too literally. It really means an excess of the normal extravascular or interstitial fluid, which is essentially a low protein ultrafiltrate of the plasma containing all the diffusible electrolytes and nonelectrolytes in approximately the same concentration as the plasma, except for the small differences due to the Donnan membrane equilibrium. The chief electrolyte cation in extracellular fluids is sodium; the chief anions are chloride and bicarbonate.

Edema is brought about by a disturbance in the balance of forces favoring filtration and reabsorption respectively. When sodium, as sodium chloride, is ingested it is absorbed as an isotonic solution, increases the plasma volume and is filtered by the capillary blood pressure into the interstitial spaces. If the sum of factors in the reabsorption of tissue fluids (plasma protein osmotic pressure, tissue pressure and lymphatic drainage) is less potent than the sum of factors in filtration (capillary blood pressure, amount of protein in interstitial fluid, local tissue metabolism), an excess of saline solution will remain in the tissue spaces. If, on the other hand, sodium is restricted in the diet or its normal absorption from the lumen of the renal tubule is diminished by the action of diuretic drugs, urinary loss of sodium (and chloride and water) soon reverses the stream and more interstitial fluid moves back into vascular channels until a new equilibrium is established. If sodium chloride could be given in large amounts with little water so as to render the body fluids high in salt concentration, diuresis would undoubtedly result even in an edematous patient. In other words, the tissues in edema do not retain sodium but simply contain an excess of interstitial fluid with their normal sodium concentration. Some tissues, like bone and certain types of collagen, contain sodium in "bound" form, not freely exchanging with the sodium of interstitial fluid although participating in the uptake of radioactive sodium.

The exchange of muscle cell potassium for sodium which is seen after severe trauma, burns, severe dehydration with loss of muscle cell water and its contained potassium or after excessive administration of desoxycorticosterone in animals (and probably in man) is not a true tissue retention of sodium and is not to be identified with edema in the ordinary sense, since the water content of the affected muscle cell is not increased. On the other hand, the decreased excretion of sodium which is the result of desoxycorticosterone effect on the renal tubular reabsorption reflects itself in an increased plasma volume, increased blood pressure and ultimately increased filtration of plasma water and its contained electrolytes into interstitial spaces, producing edema.

On the whole, therefore, the concept of the permeability of the capillary wall is best omitted in the consideration of ordinary cardiac or renal edema, since changes in permeability to electrolytes and water do not play a significant role in this type of edema.

CARBON 13

To the Editor:—I have recently received a letter from France stating that "the newspapers of France have published articles on Carbon 13 which should be a sensational American discovery in the fight against cancer." Can you give any information concerning this subject?

Campbell Howard, M.D., New York.

ANSWER.—Carbon 13 is an isotope of "normal" carbon 12, from which it differs by having an extra neutron in its nucleus. It is stable and not radioactive. It has not been found useful in the treatment of any disease. However, it has been useful in studies of metabolism. Carbon 13 has chemical properties identical with carbon 12 but weighs more. Hence compounds may be marked or "labeled" by the presence of carbon 13. This permits the tracing of the intermediate stages of metabolism which compounds undergo after ingestion. A wide field of investigation is thus opened by the use of carbon 13 for the solution of many metabolic problems. The study of intracellular metabolism is extremely important in cancer research. Although at the present time physical instruments for measuring isotopes are not sensitive enough to enter individual cells, carbon 13 can be used for studies of tissue metabolism.

The quantity of carbon 13 was minimal until the recent erection of a thermal diffusion plant by the Houdry Process Corporation, Marcus Hook, Pa. The Sun Oil Company has recently begun construction of a large plant for the same purpose.

SENSITIVITY TO SULFADIAZINE OR FISH POISONING

To the Editor:—A man aged 60 with calculosis of the left kidney accompanied by a mild form of pyelitis became ill with fever, conjunctivitis and stomatitis in the form of many patches on the tongue, palate and cheeks two hours after taking one single tablet (0.5 Gm.) of sulfadiazine while eating a dish of fish in a restaurant. It does not seem justified to accuse such a small dose of sulfadiazine unless there exists something like a hypersensitivity. Some months ago the man had been using the same drug in moderate doses. I should like to know if such a sequence of events has been observed elsewhere. Otherwise in this case the meal of fish ought to be accused.

F. Hinrichsen, M.D., Rio de Janeiro.

ANSWER.—Fever, conjunctivitis and stomatitis are manifestations of sensitivity to sulfadiazine. A person may take sulfadiazine or any other sulfonamide without any untoward reaction; then, after an interval of some time, evidence of sensitivity to a sulfonamide may appear following an initial dose of a small amount of a given sulfonamide. However, in the case under discussion one cannot rule out the possibility of fish causing sensitization. It is assumed that the patient has eaten fish in the past without displaying evidence of sensitivity. If this is true, then sensitization to sulfadiazine should be seriously considered. Tests for eliciting sulfonamide sensitivity are unsatisfactory. If there is any doubt about a patient being sensitive to the drug he should be given a single tablet and then observed for six to eight hours. Usually within this time he will display signs of sensitivity such as nausea, vomiting, fever, chilly sensations and at times a dermatitis.

SERUM PHOSPHORUS IN HYPERPARATHYROIDISM

To the Editor:—Is there any explanation why the serum phosphorus is low in hyperparathyroidism? Why do so many diet experts recommend the use of beef in diet lists and do not allow veal though veal is more tender?

Anthony Pirrone, M.D., Cleveland.

ANSWER.—The changes in calcium and phosphorus metabolism characteristic of hyperparathyroidism are increased serum calcium, increased calcium and phosphorus excretion and decreased serum phosphorus.

Jaffe suggested that the parathyroid hormone in some way mobilizes the insoluble calcium salts of the bone and thereby raises the serum calcium level. Since calcium and phosphate ions form a slightly soluble salt, the increased serum calcium would drive the phosphate ions from the serum into the bone and thereby lower the concentration of the phosphorus in the serum. This hypothesis is supported by the work of several recent investigators quoted by Pope and Aub, who found indications that the parathyroid hormone acts primarily to mobilize calcium from the bone.

On the other hand, Albright and Ellsworth suggested that the primary action of the parathyroid hormone is to increase renal excretion of phosphorus. This is supported by the Harrisons, who showed that parathyroid hormone decreases renal tubular reabsorption of the phosphate ion. This results in a low serum phosphorus, which allows withdrawal of calcium from the bone to raise the serum calcium level. The increased serum calcium level then leads to increased urinary excretion of calcium.

These two hypotheses may eventually be reconciled. It is probable that both mobilization of calcium from the bone and increased renal excretion of phosphate ion are effected by the direct action of parathyroid hormone.

The omission of veal from diet lists must be presumed to be without significance, since there is no essential difference in the relative nutritive value of beef and veal. A comparison of their relative composition, such as that given in a recent publication of the Department of Agriculture, shows that they are practically identical, the only difference being a slightly greater concentration of niacin and riboflavin in veal than in beef.

EMPYEMA AND PENICILLIN THERAPY

To the Editor:—Is it possible that, following treatment of a bacterial empyema with penicillin administered intrapleurally, the micro-organisms are completely eliminated and the inflammation persists for a considerable length of time? In other words, is persistence of exudate, even when bacteriologically sterile, evidence of bacterial infection not elucidated?

M.D., New York.

ANSWER.—Bacteria may disappear rapidly or dead bacteria may be demonstrable in the pus after penicillin is injected into the pleural cavity during empyema, but some time is required for the resorption of pus. Therefore the persistence of exudate does not necessarily indicate continued bacterial infection or inflammation. However, sterile pus acting as foreign protein material may cause a degree of inflammation. The matter was discussed by Poppe in THE JOURNAL, Oct. 6, 1945, page 435. He recommends a week's observation after discontinuing penicillin to determine whether residual infection still remains. Relapses occurred in half of his patients. Surgical drainage is necessary when turbid pleural effusion persists after a pyogenic infection has been adequately treated with penicillin.

EFFECT OF ACETYLSALICYLIC ACID ON LEUKOCYTE COUNTS

To the Editor:—Does aspirin have any effect on the white blood cell count and, if so, what effect? Further, if aspirin does affect the white blood cell count, would 10 or 15 grains of aspirin daily have such effect?

J. D. Riley, M.D., Booneville, Ark.

ANSWER.—There is no evidence that aspirin (acetylsalicylic acid) has any effect on the white blood cell count. Since aspirin is a benzene ring preparation, it might justifiably be included in the list of drugs that are known to produce reduction of white cells, but it is probable that the side chains on the benzene ring make it nontoxic. There have been rare reports in which aspirin is believed to have caused thrombocytopenia or hypothrombinemia resulting in a hemorrhagic syndrome. These are probably instances of idiosyncrasy to the drug.

SOLUTIONS TO USE IN THE NOSE

To the Editor:—I have been using mild protein silver packs in the nasal cavity to promote profuse discharge. Some patients object to this, stating that it causes irritation. Can you supply me with one or more prescriptions that I may use for this purpose? M.D., Washington.

ANSWER.—Before answering the question it may well be asked to what purpose one would wish to use a preparation for the sole purpose of promoting a profuse discharge. The latter may mean no more than a response to undue irritation.

Investigations in the past few years have been devoted to the idea of using preparations in the nose compatible with the proper physiologic functioning of the nasal mucosa.

Such solutions as recommended by N. D. Fabricant (Nasal Medication, Baltimore, Williams and Wilkins, 1942) and others, whether used in packs, sprays or as drops, should have a moderate decongestant effect and may contain biotics such as microform sulfathiazole crystals, tyrothricin or penicillin but should not vary greatly in their p_H (5.5 to 6.5) from that of normal nasal secretions, nor should they be harmful to ciliary action. They should not injure the nasal mucosa and should be isotonic with the blood. They should not cause undue secondary side reactions, such as increased nasal congestion, watery secretion or sneezing. Preparations too that cause the blood pressure to rise unduly should be avoided. A number of good preparations are on the market and contain either the salts of ephedrine or those of closely allied synthetically prepared substances.

CHEYNE-STOKES RESPIRATION

To the Editor:—I have Cheyne-Stokes respiration, beginning about eight months ago. I have mild bronchiectasis, perhaps better termed chronic bronchitis. My age is 70; my blood pressure is 70/120; my heart had always been good until this began, doubtless from overwork with the ever present flu, which has been disturbing heart and musculature. I have been using aminophyline. How about histamine—what is the suggested dosage? I am better lying down with two pillows, though I drive my car and walk about without any thought of weakness unless too long continued.

M.D., California.

ANSWER.—Cheyne-Stokes respiration, a waxing and waning type of breathing in which the respiration is at first slow and shallow, then gradually builds up to a maximum in depth and rate only to subside again and finally cease for a short time, is occasionally found in normal adults during sleep. The most common clinical conditions in which it is found are advanced renal and heart disease, asthma and increased intracranial pressure. The pressure of orthopnea in this case (as judged by the need of two pillows when lying down) suggests the pressure of cardiac insufficiency.

Since therapy is decided by the chief cause of the Cheyne-Stokes respiration, a careful evaluation of the cardiac and renal status is indicated. Treatment directed toward an abnormality of the cardiorenal systems probably will have a secondary beneficial effect on the respiration. Histamine has a definite tendency to produce a fall in blood pressure and thus is not indicated for treatment of Cheyne-Stokes respiration. Occasional rebreathing, or the use of a 7 per cent mixture of carbon dioxide in oxygen, may help to stabilize the respiratory rhythm.

INSOMNIA AND HYPERHIDROSIS IN CIRCULATORY DISORDERS

To the Editor:—A man, aged 67 has had a hypertension for the last twelve years or more but, until December 1944, never had any confining sickness. At that time, though, he suffered an attack of angina and was in the hospital for a week. About a month later he had an attack of complete suppression of urine, relieved only by catheterization. On Feb. 1, 1945 a transurethral prostatectomy was performed with uneventful recovery. His work consists entirely of office work, not requiring any physical effort more than driving an automobile to the office and back. On Oct. 5, 1945 the patient had what was obviously an attack of angina with coronary occlusion, accompanied by shortness of breath, and has been confined to bed since that time for complete rest. Each morning at about 6 o'clock he wakes up and becomes drenched in a cold, clammy perspiration. The appetite is poor. The only medication taken is digitoxin, and because of insomnia he takes from 0.1 to 0.2 Gm. pentobarbital sodium. Could you suggest something to stop this hyperhidrosis as it is the most disagreeable part of the illness. M.D., West Virginia.

ANSWER.—The early morning perspiration described suggests a reaction to some circulatory disorder. One of the causes of insomnia and of early awakening is pulmonary congestion and that, when moderately acute, can give rise to perspiration. It would be wise, therefore, to look for pulmonary congestion and to treat it if found by diuretic therapy and perhaps low salt intake as well as by digitalis. The poor appetite may be due either to congestion or to the effect of digitalis. There is no information on the production of perspiration by pentobarbital sodium or by digitalis. Now and then insomnia may be relieved in persons who have left ventricular strain and failure, not by hypnotics, but by diuretics.

OPERATIONS ON CLITORIS FOR FRIGIDITY

To the Editor:—While I agree with the reply to Dr. Frank E. Hyde's question about operations on the clitoris for frigidity or reduced libido as far as the effect of such operations is concerned (with the exception that the glans clitoris should be exposed if it is entirely covered by a prepuce), I take definite exception to the statement from Greenhill. This no doubt comes from "Frigidity in Women," by Hitschmann and Bergler (Washington and New York, Nervous and Mental Disease Publishing Company, 1936). Thousands of women who are normal in every way sexually and have one or more orgasms spontaneously in each act of intercourse will testify that the clitoris is the principal erogenous zone. Havelock Ellis made clear the relative insensibility of the vagina. In my opinion there is no such thing as a "vaginal orgasm," for there are no genital corpuscles in that organ. In both sexes they are found only in the head of the phallic organ. Only through these specialized nerve endings (cerebrally or locally stimulated) can the orgasm be initiated and felt.

ANESTHESIOLOGY IN THE HOSPITAL AND IN THE MEDICAL SCHOOL

RALPH M. WATERS, M.D.
Professor of Anesthesiology, University of Wisconsin Medical School
Madison, Wis.

Two circumstances have been blamed for the delay or reluctance in accepting to the fullest the service which modern anesthesia might render. One is the lack of a sufficient number and quality of physicians prepared to accept the responsibility. The other, sometimes suggested as a cause for the first, is the existence of widespread abuses, exploitation and all round lack of appreciation of those who are devoting their energies to the specialty. The present would seem to be an auspicious time to reconsider the subject and to discuss how anesthesiology can best serve the needs of the medical student, the surgical profession, the hospital and, most important of all, our patients. During the war many surgeons for the first time observed the advantages of medical training as the foundation for an anesthetist. At the same time the number of physicians who realize the importance and attractiveness of anesthesiology as a major interest has been increased by several hundred per cent. We are now at a crossroad. Either we must take advantage of this new realization of the importance of anesthesia and of the interest and enthusiasm of returning "military anesthetists" or we shall continue the former abuses, neglect and exploitation of anesthesia and anesthetists. In the first instance patients will receive in the long future the best service in anesthesiology which current knowledge makes it possible to give them. In the second, that service will retrogress to a new low of neglect.

In order to establish a reasonable view of the problem we must disabuse ourselves of a generally held belief that the importance of anesthesiology lies in the "choice of agents" or in the particular "technic" employed. All drugs and the methods by which they are administered are subject to abuse. Through fundamental knowledge and diagnostic skill the abuses are avoided or neutralized, quite as much as by artful technical manipulations. The unimportance of the chosen drug is shown by the accompanying illustrations. An outline of experiments comparing some effects of vinyl ether, trichlorethylene and chloroform appears in table 1. It is evident that chloroform, an old but now almost discarded drug, does not come off second best when compared with two new agents which have been accepted with considerable enthusiasm. A statistical evaluation of results following the administration of common agents at Wisconsin General Hospital is presented in tables 2 and 3, the former showing the incidence of major pulmonary complications and the latter of "hospital" deaths occurring in the daily work of the institution. It will be noted that the variation in results is not wide following the use of the several agents. If time for discussion permitted, it could be shown that such variations as do exist are better explained by the preoperative condition of patients, the nature of operations and the lack of training and the inexperience of anesthetists rather than by correlation with the drug chosen or the method of its administration. For instance, both death rate and pulmonary morbidity were high among patients credited to nitrous oxide and "other" inhalation agents. However, nitrous oxide, combined with high percentages of oxygen, was often used in cases in which the physical condition was desperate or the need for oxygen administration acute. Likewise the addition of "other" agents was often in the presence of incurable disease in order to study the effects of drugs with which we were less familiar.

It's not the tools but the way the tools are used. The future of anesthesiology, as I see it, is not dependent on the discovery of new drugs but may be boiled down to two efforts: (1) elimination of certain abuses which are common and accepted practices in our country and (2) the establishment of an understanding by schools, the profession and the public of what anesthesiology really implies in the hospital and in the medical school.

ABUSES

To enter into a detailed and comprehensive discussion of the abuses of anesthesia, of the anesthetist and by the anesthetist is not the present purpose. Doubtless a complete survey of the whole country ought to be made in order to call to our attention the various and sundry sins of omission and commission which we are permitting to continue, largely without realizing their harmful effects on the service which our patients receive. A brief enumeration of a few of these abuses will illustrate what is meant. The following quotations extracted from resolutions adopted by the Board of Trustees of the American Medical Association, after they had been accepted by the American Hospital Association and other national bodies, state the ideals of organized medicine:[1]

> A qualified medical specialist in anesthesia is entitled to recognition as a professional member of the medical staff and as head of a hospital department. . . .
>
> Neither the hospital nor the anesthetist should exploit the patient or each other.

and yet widespread disregard of these precepts is common. A well organized and adequately staffed department of anesthesia is the exception rather than the rule in our hospitals. The administration of such departments as do exist is too often dominated by hospital executives or others whose vision of the ideal is blurred by a desire to avoid entries on the debit side of the ledger. The employer of a physician well trained in anesthesiology, on a restricted salary and with an inadequate number and quality of assistants, exploits that physician. If the employer collects as anesthetic fees from patients more than is spent to provide service in anesthesia, the public is exploited. No less blameworthy is the physician who, although a competent anesthesiologist, hires inexperienced, untrained physicians or technicians at inadequate salaries so that he may appear to serve more private patients—and collect more fees.

---

[1] Anesthesia Service in Hospitals, J. A. M. A. **114**:1260 (March 30) 1940.

TABLE 1.—*Effects of Anesthetic Agents on Dogs* *

	Hepatic	Renal	Cardiac
Divinyl ether (vinethene)	Central zonal necrosis to acute yellow atrophy	Definite impairment; urea clearances 10%; to anuria	None
Trichlorethylene (trilene)	Minimal hydropic to fatty degeneration	No definite impairment	Severe (ventricular tachycardia)
Chloroform	None to minimal hydropic degeneration	No alteration of function	Moderate (ventricular tachycardia rare)

* The three agents were administered to dogs by the carbon dioxide absorption to and fro technic, particular attention being paid to adequate oxygen tension in the respired atmosphere and to adequate ventilation of the lungs. Administrations, one hour in duration once a week, were repeated to produce structural as well as functional hepatic and renal damage if possible. The general picture rather favors chloroform in the comparison.

The patient's "fear of an anesthetic" is proverbial. Perhaps the contempt bred of familiarity which dominates the attitude of those of us who work in operating rooms is more illogical than the patient's fear. The needs of many modern surgical operations demand that the patient be carried much nearer to a fatal dose of drugs than does any other branch of therapeutics. Cases are not rare when diagnostic acumen and swift change in the plan of management are matters of "life and death." But care of the patient during operation is only one of many services to patients, surgeons and hospitals which may be considered a part of anesthesiology. The public wants the best service obtainable and for that it has always been willing to pay. If present abuses and injustices can be eliminated, even now patients pay enough to secure much pleasanter and safer service than they are getting. The best would be willingly purchased. What we need for the future is to determine how best to organize the service of anesthesiology in the hospital and in the medical school.

COSTS

In line with practice common in the other surgical specialties, the professional anesthetist has, in the long past, collected his income directly from his patients. Since the fees of the surgeon were very large in comparison with those of the anesthetist, the latter found it necessary to administer many more anesthetics than the surgeon had to perform operations in order to acquire a satisfactory income. Under these circumstances every minute of his working hours has to be arranged very carefully if his many small fees are to equal one or two of those received by the surgeon. The burden of "free" cases and extremely long operations may fall with considerable injustice on the anesthesiologist. With increasing duties outside the operating room which the practice of anesthesiology now implies, various plans are being tried for equitable distribution of the funds collected. Full time and part time salaries, percentages based on the work done and skill required, or these combined with private fees are some of the methods in use. Probably no one plan will be found best for all institutions. The important thing is to avoid "exploitation," to be sure that sufficient funds are set aside or collected to pay adequately for good service in anesthesiology and then to guarantee that such funds be used to provide such service and for no other purpose.

ORGANIZATION

The accompanying diagram is an outline of service in anesthesiology which may be split apart to apply to various types of institutions. The word "salaries" in the figure had better be read "remuneration" since, where private cases predominate, the fees collected directly may constitute the whole or a part of the source of income. In any case the organization of a real "department of anesthesiology" is desirable in order to provide unity of effort and efficient twenty-four hour service in whatever meaning the word is taken to imply in a given hospital. Whether intravenous therapy, inhalation therapy, block anesthesia for diagnosis and therapeutic purposes, the care of acute pulmonary difficulties or other services are included is a matter for decision by each hospital staff. Responsibilities will be assumed as individual skills and interests develop.

The diagram includes both hospital and medical school relations because organizations in a majority of our medical schools are as yet in the gestation period. Certain mistakes have been made in starting new departments. The most common, in hospitals as well as in the university hospital-medical school setup, is the misconception that a single experienced and capable individual can constitute a department of anesthesiology and can care for the multifarious duties in even a small hospital. The diagram at the upper left emphasizes the fact that service, even in the operating room, requires at least one competent supervisor for each three operating teams if safe practice is to be maintained.

TABLE 2.—*Major Respiratory Complications* *

Agent	Number of Cases	Incidence	
		Cases	Per Cent
Cyclopropane	10,607	229	2.16
Ether	5,203	143	2.74
	2,114	76	3.59
	624	31	4.96
Intravenous barbiturate	1,398	16	1.14
Regional agents	3,017	79	2.61
Others	263	4	1.52
Total	23,226	621	2.67

* This table indicates that the percentage of major respiratory complications does not vary widely. The physical state of the patients receiving nitrous oxide and "other agents" is believed to explain the higher percentage with these agents rather than effects of the drugs.

In institutions where the geographic spread of operating rooms is wide or where the incidence of serious operations is great, maximum safety may demand an experienced and competent anesthetist for each operating team. A single person may of necessity be asked to initiate the organization of a department. However, unless sufficiently competent associates can be added shortly, the individual's health will suffer and the service will fail. One individual cannot be in several places at one time. A "department" implies sufficient personnel, not a single individual trying to teach a large group of neophytes or to supervise a similar number of technicians.

TEACHING

Modern hospitals are medical teaching centers, good or bad, whether they wish it or not. If we in medical schools who have contact with undergraduate medical students did our full duty, interns and residents would come to the hospital well founded in the basic knowledge necessary for clinical teaching of anesthesiology. Since we still fall short of that goal, a brief intensive course to cover the basic need is contemplated in some schools, as is indicated at the lower right of the diagram. Such courses, given in medical schools, may be combined with residencies in hospitals where clinical material, clinical teaching and capable supervision are available but a faculty-team in a medical school is not possible. Experience has taught that, however excellent the instruction in anatomy, physiology, pharmacology and biochemistry in the regular curriculum, these matters need to be reconsidered and emphasized in the light of clinical experience in anesthesiology. Results of such short graduate courses for medical officers during the war support the belief that they may prove very valuable if suitable curriculum and teachers can be arranged.

TABLE 3.—*Deaths in the Operative and Postoperative Periods* *

Agent	Number of Cases	Deaths	
		Cases	Per Cent
Cyclopropane	10,607	225	2.12
Ether	5,203	123	2.36
Nitrous oxide	2,114	102	4.8
Other inhalation	624	27	4.33
Intravenous barbiturate	1,398	24	1.7
Regional agents	3,017	108	3.57
Others	263	12	4.56
Total	23,226	621	2.67

* Comparable to table 2, the higher death rate following nitrous oxide and "other agents" is believed to be due to the preoperative condition of the patients.

No less important than graduate teaching is that to which the medical student is exposed. Both must be conducted from the point of view of the hospital, not the laboratory. The sixteen lecture-demonstration-discussion periods shown in the diagram as required of third year students prove to be a minimum of time in which to reinterpret and apply the undergraduate's previous knowledge of basic science to the problems which he must solve in the hospital. On graduation he ought to have sufficient knowledge of anesthesia to distinguish the good from the bad, and in addition every physician must have a clear concept of the physical as well as the physiologic factors of the respiratory and circulatory systems. Since care of sudden changes in these factors is the hourly concern of the anesthesiologist, he has been considered the teacher most likely to equip the medical student to deal with the emergencies he will later encounter. All this, in my estimation, is essential to the education of a medical practitioner whatever his plans for the future may be.

Research is often looked on as the chief end to be attained by a director or a department. To my mind it ranks third in the objects sought. Service to patients, teaching and lastly research is the order of importance as I see it. In the diagram, research is under the medical school. However, just as with teaching, I believe that research should be a cooperative effort between the faculty of medicine and the hospital staff. If new drugs are to be investigated or old ones studied, the laboratory first, then the operating room should be the order of attack. It is important for the anesthesiologist to be familiar with laboratory customs, language and literature. It is no less important for certain workers in the laboratory to become familiar with the problems of the operating room and the ward. Much wasted effort in unnecessary experimentation can be avoided by interdepartmental friendship and understanding throughout the medical school and hospital.

RELATIONS WITH THE SURGICAL DEPARTMENT

The primary duty of anesthesiology is service in the operating room to the surgeon and to his patients. At the same time every department of the hospital can benefit by the help of the anesthesiologist on certain occasions. Should the department be a subdivision of the department of surgery or should it be a separate entity? In the diagram it is shown in the latter relation because experience has demonstrated that this is the more satisfactory to all concerned. Such independence, however, implies an exceptionally sympathetic attitude toward surgery. Those who take part in a surgical operation should form a "team" in the best sense of the word. The attitude of the anesthesiologist in that team must be one of the utmost cooperation—cooperation even to the point of subservience when subservience is necessary for the best accomplishment of the team. But never subservience beyond that point. The anesthesiologist is the colleague of the surgeon. The patient is best served by their mutual friendship and joint discussion of the problems involved in his care. Young anesthetists and surgeons must be warned against acquiring a critical attitude toward each other.

Composite diagram of departmental organization. The scope of the effort and the size of the institution will determine the number of individuals needed. Under "Budget," salaries should be understood to mean "remuneration," since private fees may constitute all or a part of the financial support.

There is ample opportunity for the display of the talents of the anesthetist in anesthesiology and of the surgeon in surgery. The attitude of each toward the other can benefit by previous experience in the general practice of medicine. The precepts exemplified in the golden rule should govern their personal relations. In too many of our hospitals anesthesiology suffers because of domination by the department of surgery or by the administrative office of the hospital. Patients will receive the best service in a hospital where the personnel deserves and receives the respect of the whole institution.

TECHNICAL ASSISTANTS IN ANESTHESIOLOGY

Habit determines the routine of our daily lives. Once we are accustomed to doing a thing in a certain way, that becomes and remains the right way unless we devote some real thought to the matter in reconsideration. Some assistance for the woman in labor was found necessary in very early times. Women and the medical profession accepted the midwife as the usual assistant at parturition. The physician was called in only after the customary practice had failed. It was but little over a century ago that Dr. Gregory was fined a hundred pounds sterling in the courts of Edinburgh, Scotland, because of a public caning which he had administered to Dr. Hamilton. Gregory was then professor of physic, or what we call internal medicine, at the University of Edinburgh, and Hamilton was the predecessor of Sir J. Y. Simpson in the chair of midwifery. After paying the fine, Gregory is said to have remarked that he would gladly repeat the experience since he could not abide the pretentions of the nonentity who represented on their faculty the despised art of midwifery. The midwife custom prevailed at that time. Anesthesia came to us one hundred years ago. Compared with obstetrics it is in its infancy. Perhaps it is not strange that in many communities it has become a custom in our country to hold nurses responsible as technicians in anesthesia. Is this right or is it wrong? If we employ nurses or other nonmedical persons as technicians only, as assistants in the care and preparation of equipment, in supervising depressed patients, and in various other ways where diagnostic and therapeutic decisions are not involved, their services can be valuable. On the other hand it is unfortunate, and I believe definitely wrong, when doctors—whether surgeons or anesthesiologists—find it necessary to serve as a figurehead in assuming responsibility for the acts of technicians which involve decisions of a medical nature, decisions in which they take no part. A modern surgeon's duties require all of his attention during operations. Few anesthesiologists can be expected to maintain intelligent contact with more than 2 or 3 cases at one time. If we saddle nurses with the responsibility of anesthesiology and collect from our patients what amounts to professional fees for their services, pocketing the surplus or allowing them to do so, it constitutes exploitation of the public. If we attempt to teach nurses the science and art of anesthesia, that is also wrong because it exploits the medical students who wish to learn anesthesiology while in school and may wish to practice it after graduation. The student will not take kindly to the sort of instruction which can be superimposed on the preliminary training of a nurse, nor will he look with favor on a specialty which is in competition with those who are not medically trained. The argument is offered that an experienced technician often administers anesthetic drugs better than a physician. Individual comparisons may support such a contention. But similar individual comparisons may be made regarding the performance of minor surgical operations. A demonstration was made in earlier times regarding obstetrics. And yet we now approve of 20 to 30 per cent of the medical student's time, in his last two years, being devoted to instruction in obstetrics and gynecology. Midwives are rare. Rightly, nurses are given a course in obstetric nursing just as they ought to be in anesthetic nursing, but attempts to make anesthesiologists of people without a medical background will delay or prevent the future service which ought to be expected from anesthesiology. New drugs, new technics, the study of older ones, teaching and organization, all must depend on the competence of interested and enthusiastic physicians. Unless they are to be allowed to put in practice their discoveries, unless their specialty receives recognition and respect when it deserves it, interest and enthusiasm will fail. Capable brains will look elsewhere for employment.

SUMMARY

The public as a whole is not receiving the best service that anesthesiology is capable of supplying. A reason often cited is that anesthesiologists are not available in sufficient quality or number. This deficiency is due to a variety of abuses which have become common practice in the hospitals of this country. A custom, once established, is accepted indefinitely unless its effects are analyzed periodically. The present seems an auspicious time for us to devote some intensive consideration to existing abuses of and by anesthesiology with a view to improving the care of patients. Proper education of undergraduate and graduate students in our medical schools and hospitals is one method leading to improvement. Another is through the organization of departments of anesthesiology in medical schools and hospitals.

There is danger of the "vicious circle" type of influence on progress. To force nurses to assume the practice of anesthesiology interferes with proper teaching of medical students and young doctors. These in turn begin practice with inadequate knowledge of anesthesiology. As "authorities" in the profession, they later will accept inadequate service as satisfactory and withhold economic and professional recognition of anesthesiologists. Young doctors will hesitate to come to an unrecognized specialty. With fewer physicians, more anesthetic nurses will be required. The ultimate result might become a technical nonscientific service in anesthesia with no one in the medical profession competent to criticize it.

Abuses and undesirable customs of practice have crept upon us. In many instances this has occurred without those who are responsible being aware of the far reaching effects. The imminent return of many hundred medical officers whose interest in anesthesiology has been stimulated by the exigencies of military service creates an auspicious time to correct our mistakes.

Material and Immaterial Values of Science.—There are certain values of science which stand half way between the crudely material values on the one hand and the immaterial values on the other. Knowledge of the facts of equal inheritance from both parents (apart from the genes borne on the sex chromosomes) is important in framing people's general social outlook, but it does not directly provide them with food, health or shelter. The relative status of man and woman would be different from what it is if people believed that inheritance were wholly maternal (as the Trobriand islanders, for instance, are said to believe) or wholly paternal (as some biologists once thought). Again, people's social outlook is affected by their beliefs on the scientific question whether what are popularly called "acquired characters" are inherited. The function of science in reducing superstition comes into this category of values.—Baker, John R.: Science and the Planned State, New York, Macmillan Company, 1945.

"EARLY" CALCIUM UROLITHIASIS

R. H. FLOCKS, M.D.
Associate Professor, Department of Urology, University Hospitals
Iowa City

It has been shown that conditions in which immobilization of the individual is present, in which portions of the urinary tract are paralyzed and in which obstructions and infections of the urinary tract occur, or in which pronounced dehydration is present are likely to lead to calcium urolithiasis. Since the incidence of these conditions has risen decidedly as the result of the war, the importance of this phase of calcium urolithiasis has correspondingly increased, and I believe at the present time this is probably the most common type of urolithiasis.[1]

The probable mechanisms involved in the formation of the stone in these situations is discussed in a previous article. They involved essentially three factors: infection, stasis and hypercalcinuria. The outstanding fact in the vast majority of such cases is the presence of multiple small precipitates of calcium phosphate in the calices and pelvis of the kidney. These may form within eighteen days after the onset of the predisposing factors and grossly resemble the situation with sulfadiazine and sulfathiazole precipitates. These small stones may all pass, they may fuse to form one or more larger stones; they may act as the nucleus for larger stones; and they may be "silent" over long periods of time, at the same time causing very considerable and, at times, irreparable damage to the urinary tract before symptoms occur. This situation in the first six to eight months after the onset of the predisposing conditions before the stones have become intimately mixed with organic material and definitely solidified may be called "early" calcium urolithiasis. There are two outstanding characteristics of this phase of the condition: First it may be "silent" —produce no clinical manifestations—and, therefore, repeated x-ray examinations may be necessary to recognize it.[2] Second, the peculiar character of the stones formed under these conditions is such that special types of treatment are necessary if the best results are to be obtained.

It is my purpose in this paper to describe the clinical, pathologic and roentgenologic characteristics of these stones—so-called "early" calcium urolithiasis—and follow this with a discussion of the treatment of patients with this condition.

The outstanding fact of the early symptomatology of calcium phosphate renal lithiasis is that there are no symptoms. In other words, precipitation of the crystalloids and the formation of the stone take place gradually, with varying rapidity, under the influence of the predisposing factors, with no symptomatology, so that in many of these cases the diagnosis is first made by means of an x-ray film (table 1). After a varying interval symptoms occur in one or more of the following ways: (1) Irritation by small stones may produce hematuria, (2) the passage of a small stone down the ureter may produce ureteral colic, (3) infection may occur as the result of the obstruction caused by the stones. As a result of this there may be pyuria alone or with the generalized symptoms of infection: i. e. chills, fever, leukocytosis and pain over one or both renal regions.

The case illustrated in figure 1 gives the characteristics when infection is not present and no renal damage has as yet occurred. Note that the kidney and pelvic outlines are normal, there is only a slight hematuria and one attack of colic occurred four months after the onset of predisposing conditions. Note the presence of stones in each of the three major calices fitting about the pyramids. Note the excellent response to an acid ash diet and increased movement and urinary output. Such an early case remains in the "early phase" (i. e. nonhardened or consolidated stage) for many many months and therefore is amenable to irrigation therapy for a long time. This type of stone is ideal for dissolution by means of a combination of fluids, diet and irrigation therapy. Usually following treatment the urinary tract is left perfectly normal and the prognosis is excellent if the predisposing factors have been done away with. The pathologic changes in the cases of simple precipitations about the pyramids or in the kidney pelvis itself are very slight. The entire kidney and kidney pelvis are normal except for evidences of slight irritation of the mucosa by the precipitated particles. Occasionally, in patients with frank hypercalcinuria, precipitations are present in the tubules.

Table 1.—*Conditions Predisposing to Calcium Phosphate Urolithiasis*

1. Disease producing prolonged immobilization of the body:
    a. Fractures of the spine or extremities associated with prolonged immobilization of large bones
    b. Chronic osteomyelitis
    c. Chronic arthritis or other bone joint disease producing immobilization of large portions of the skeleton
    d. Neurologic damage as a result of trauma or disease producing prolonged immobilization
    e. Chronic visceral disease requiring prolonged recumbency
2. Changes in the urinary organs:
    a. Congenital anomalies associated with stasis
    b. Acquired obstruction—stricture of urethra and the like
    c. Paralysis of urinary passageway
    d. Introduction of infection into urinary tract
    e. Foreign body in urinary passageway
3. Endocrinopathies:
    a. Hyperparathyroidism
    b. Hyperthyroidism?
    c. Hyperpituitary disease?
4. Focus of infection elsewhere in body?
5. Vitamin deficiency or excess
    a. Vitamin A deficiency?
    b. Vitamin D excess
6. Metabolic abnormalities
    a. Idiopathic hypercalcinuria
    b Changes in colloids?

Note. Conditions with question mark are put in mainly on a theoretical basis. Others are put in on the clinical basis.

In contrast, with the onset of infection there is much more rapid growth of stone, more extensive precipitation and, histologically, in addition to evidences of round cell and polymorphonuclear infiltration in the pyramids there may be precipitations of calcium phosphate in the tubules, ulceration of the tips of the pyramids and sometimes calcifications on these ulcerations (fig. 2). This occurs more frequently when infection is present than even in the presence of hypercalcinuria. Occasionally, possibly associated with focal infection, there is a localized area of ulceration with plaque formation such as described by Randall. The presence of severe infection alters the problem. Adequate drainage must be instituted at all costs and the infection controlled before irrigation therapy can hope to be successful. If adequate drainage cannot be instituted by ureteral catheter, open surgery must be done to do this. Otherwise very rapid growth of the stones will take place, because of

the presence of the infection. If this is done early and adequate supportive and chemotherapy instituted to control infection, irrigation can then be carried out for removal of any stones which have not been removed at the time of the nephrostomy. If this is not done early

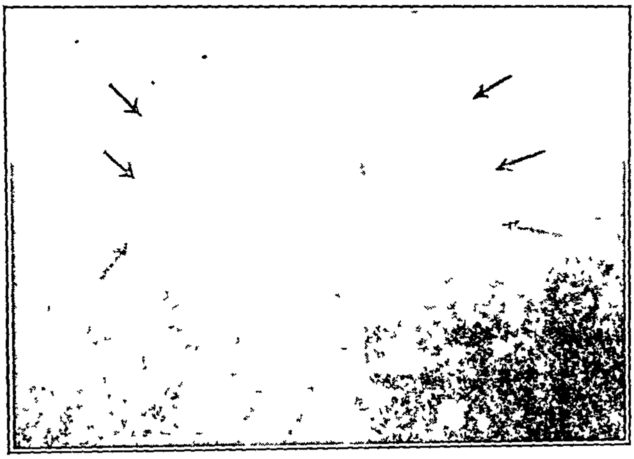

Fig 1 (case 1) —Appearance of bilateral renal calculi after a period of immobilization for bilateral slipped epiphyses Note how these follow the caliceal configuration These passed after the institution of a regimen of motion, forced fluids and a high vitamin, acid ash diet.

and rapidly there is a very good possibility of the loss of the kidney because of extensive renal damage due to the infection.

In late chronic cases with little or no infection, or a good deal of infection, there is another complication, and that is distortion of the calices and kidney pelvis with disturbance of the peristalsis of these structures due to scar tissue and fatty peripelvic and pericaliceal infiltration, so that good drainage of these structures is difficult to obtain and as a result recurrence of stone formation is a very good possibility. (Figures 3 and 4 are illustrative of late calcium urolithiasis.)

The x-ray characteristics of early calcium phosphate urolithiasis are quite definite. When slight infection is present and the case is seen early, there is a typical irregular opacity suggesting depositions of calcium salts usually around the pyramids in the calices but occasionally in the kidney pelvis itself. (Figure 5 *A*, *B* and *C* illustrates this condition.) A short history between the predisposing conditions and such x-ray films are definitely indicative of early calcium phosphate urolithiasis. When severe infection is present there is usually some evidence of consolidation of the calcium particles into definite stone, and the configuration of the calices is not always followed (fig. 5 *D*). In addition, of course, there is evidence of dilatation of the kidney pelvis in some cases and other evidences of infection and obstruction. In late cases the stone shadows are much more dense and may or may not follow the configuration of the calix. The most characteristic thing, however, is the pronounced density of the stones (fig. 5 *E*). In addition, extensive changes in the calices, kidney pelvis and kidney, associated with the long and intermittent obstruction and infection, are usually present. When the stone shadows are very dense, the condition has definitely passed from the stage of early calcium urolithiasis to the stage of late calcium urolithiasis.

The nature of early calcium phosphate urolithiasis determines its treatment, and this treatment is different from the ordinary treatment of renal stones (tables 2 and 3). Ordinarily the treatment of renal stone consists in the removal of the stone, or stones, and the correction of any changes in the urinary tract which have become associated or have occurred as a result of the presence of the stone. Moreover, any predisposing or etiologic factors which might have caused the stone are also corrected if possible. In early calcium phosphate urolithiasis one faces a peculiar situation. The stone formation is usually primarily in the calices. It is very extensive throughout the kidney. The stone, instead of being a solid, hard object is a soft, mushy thing which cannot be easily removed by the ordinary pelvic or nephrolithotomy, so that following operative procedure the incidence of recurrent stone is very high because particles of stone are permitted to remain behind, infection is introduced and new stone formation rapidly occurs. Moreover, because of the extensiveness of the stone formation and possible involvement of multiple calices, much damage is done to the kidney, the calices and the pelvis, with a great likelihood of resulting scarring, stasis and new stone formation. All in all, the conditions are ideal for either pseudo or true recurrence of the stone following operative procedure (fig. 5 *B* and *C*). To cope with such a situation the operation of Dees[3] was devised. This consists of introduction into the kidney pelvis of a substance which will coagulate and collect all the particles of stone in its meshes and then the clot is removed through the incision in the pelvis. This is of definite help but usually leaves fragments behind in the pelvis even in favorable cases which act as the nuclei for recurrences.

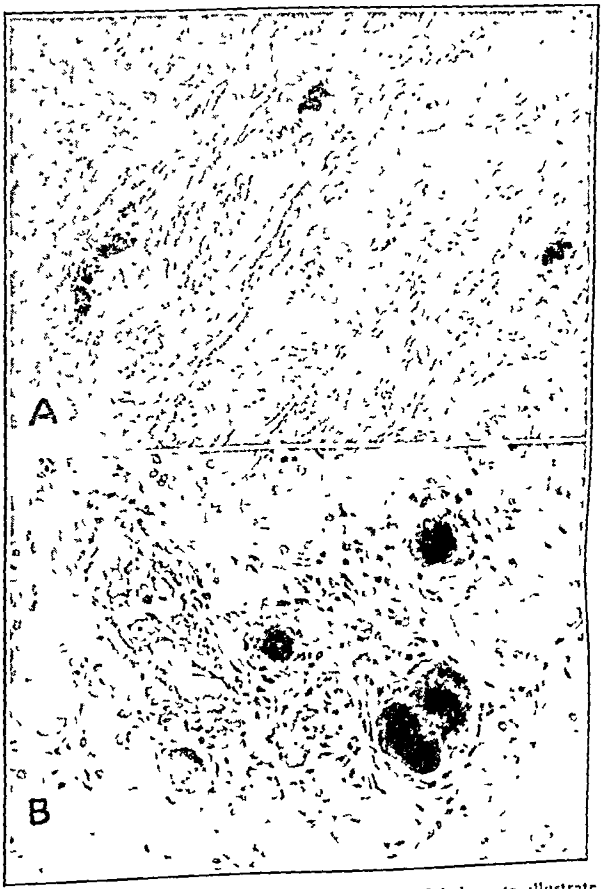

Fig 2 (cases 2 and 3) —Microscopic sections of kidney to illustrate calcium phosphate precipitations in the renal tubules in cases of renal lithiasis associated with hypercalcinuria and infection

By the early recognition of early calcium phosphate urolithiasis before decided consolidation of the stone has occurred, such an operation may be avoided. Irrigation therapy,[4] either through ureteral catheter, double ureteral catheter, nephrostomy or pyelostomy tube, intermittently or continuously, with acetic acid solutions, citrate solutions, citrate solutions with magnesium oxide, malic acid solutions and solutions containing proteolytic enzymes, will usually break up the particles and cause them to pass with the least trauma to the kidney pelvis (table 3). Infection is controlled by means of sulfathiazole, penicillin, fluids and adequate drainage. By the early recognition of this condition and the recognition of the value and possibilities of irrigation treatment, many kidneys and many lives can be saved. In fact, in "early" calcium phosphate urolithiasis open operation is contraindicated until irrigation treatment has been given a thorough trial; and, if open operation with removal of much of the stone is performed, postoperative irrigation through a pyelostomy or nephrostomy tube is of great value.

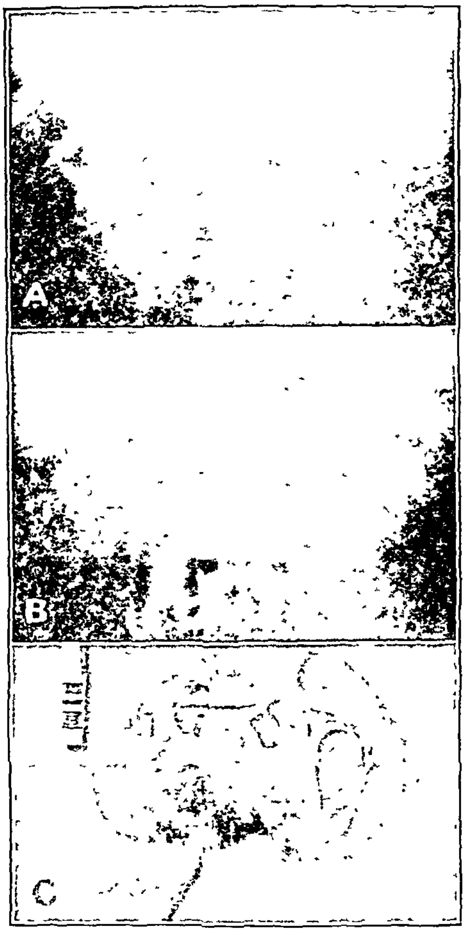

Fig. 3 (case 4).—Late calcium urolithiasis without infection: *A*, plain film; *B*, intravenous pyelogram; *C*, gross appearance of kidney.

Figures 1, 5 *A*, *B* and *C* and 6 show cases which illustrate the treatment for early calcium phosphate urolithiasis.

Figure 1 illustrates the simplest type of situation. The condition was recognized early. There was no infection, and it was possible to cause the breaking up of particles and their passage through the urinary tract by forcing fluids and an acid ash diet. Such a situation is rarely observed.

Figure 6 illustrates another situation. Here a ureteral catheter is passed up to the kidney pelvis and permitted to remain inlying. A continuous drip of dissolving solution, about 500 cc. in twenty-four hours, is permitted to run through this catheter into the kidney pelvis. This bathes the stone fragments and then passes down around the catheter into the bladder. Much fluid is given to keep the urinary output high. Manual irrigations of the kidney pelvis through the catheter are carried out thoroughly twice daily. Usually the ureteral catheter is changed weekly. In a few weeks the stone has been broken up and the particles have been removed. Infection is carefully controlled by all means at hand.

In cases in which there is much infection, in which a ureteral catheter is not well tolerated or in which dense stones (late calcium urolithiasis) are present, irrigation therapy alone is contraindicated. Open operation with removal of all stone possible followed by irrigation therapy through a pyelostomy or nephrostomy tube is the treatment of choice. Such situations are illustrated in figures 5 *D* and *E* and 7.

REPORT OF CASES

Case 1 (fig. 1).—A boy aged 16 years was placed in a double hip spica cast on Oct. 18, 1935. The urine was normal. He was in the cast until Dec. 24, 1935, at which time he had pain in the right side and hematuria. Films then (fig. 1) showed bilateral renal calculi with good functioning kidneys bilaterally and no deformity of the urinary passageways. The pH of the urine was 7.0. The calcium and phosphorus of the blood were normal. The patient was started on motion, forced fluids and a high vitamin A acid ash diet. By May 26, 1936 he had passed many small stones, and a flat film showed only one small stone shadow in the left kidney. On Dec. 15, 1936 the urine was normal, with a pH of 5.2, and the x-ray films were normal.

Case 2 (fig. 2 *A*).—A person aged 34 years, with a history of fracture of the pelvis and injury to the bladder and urethra, had a long period of recumbency, with the formation of bilateral renal lithiasis. Death was due to severe associated infection and uremia. There was extensive bilateral calcium phosphate renal lithiasis, with calcium phosphate precipitations in the tubules of both kidneys.

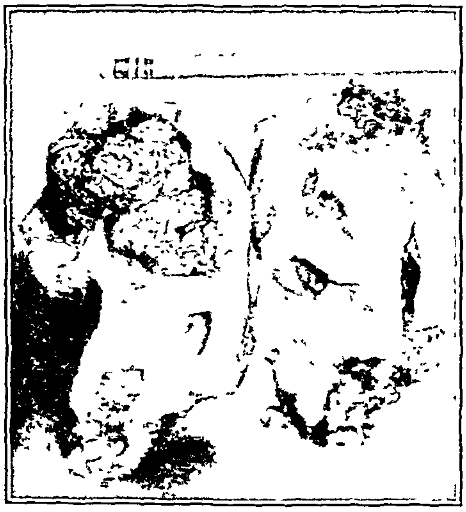

Fig. 4 (case 5).—Late calcium urolithiasis with infection. Note the hard calcium phosphate staghorn stone. Note the extensive destruction of calices and pelvis and fibrosis of the entire kidney with extreme fatty replacement. No calcium precipitations are present in the renal tissues, however.

[4] Hodge, I. T.; Hollar, B. L., and Way, R. A.: A New Series of Citrate Buffers for Use in Urinary Tract Lithiasis, J. Urol. 48: 204-206, 1942. Suby, H. I.; Suby, R. M., and Albright, F.: Properties of Organic Acid Solutions Which Determine Their Irritability to the Bladder Mucous Membrane and the Effect of Magnesium Ions in Overcoming This Irritability, ibid. 48: 549-559, 1942.

Case 3 (fig. 2 *B*).—A person was bedridden, with a large bladder carcinoma partially blocking both ureters. Bilateral extensive early calcium phosphate renal lithiasis was present, with infection. The combination of all this caused death. Microscopic study revealed extensive calcium phosphate precipitation in the tubules.

Case 4 (fig. 3).—A white man aged 47, who appeared healthy, was admitted on Feb. 7, 1944 with a history of intermittent attacks of pain going back to 1935, always on the right side. No definite etiologic factor could be ascertained. The urine showed a p_H of 6.0 and was normal except for an occasional red blood cell per high power field. Because of the presence of a normal left urinary tract and a coraliform late calcium urolithiasis on the right side with a good deal of distortion of the lower calices on the right side, irrigation therapy alone or after nephrolithotomy was felt to be contraindicated, and right nephrectomy was performed Feb. 17, 1944. The result thus far has been excellent.

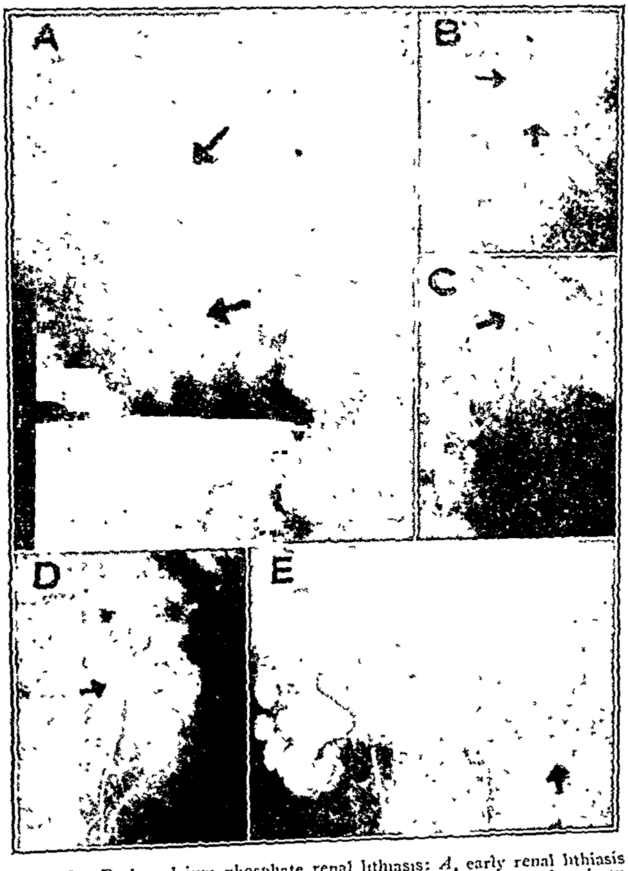

Fig. 5.—Early calcium phosphate renal lithiasis: *A*, early renal lithiasis appearing eighteen days after the onset of recumbency for pelvioplasty on opposite kidney. Routine roentgenographic check-up shows stones in the lower calices of the right kidney. These are characteristically not very dense and have the V shaped appearance because they follow the configuration of the calices Irrigation daily through an indwelling ureteral catheter with 0.25 per cent acetic acid solution caused these to disappear in five days. *B* and *C*, early calcium phosphate urolithiasis in the upper calix of the left kidney in case 6. Note the lack of density of the stone shadow and the outline of the stone which follows the configuration of the calices. Note the lack of deformity of the pyelogram. Such a situation is ordinarily ideal for irrigation therapy and unsuitable for open operation. *D*, early calcium phosphate urolithiasis Plain film Note the lack of density of the x-ray shadows with the consolidation of the stone so that it no longer follows the caliceal configuration. Such a case is suitable for irrigation therapy by ureteral catheter only if infection can be easily and rapidly controlled. It is probably best treated by pelviolithotomy followed by irrigation therapy and intensive treatment for infection. *E*, late calcium phosphate urolithiasis. Plain film showing extensive bilateral staghorn calculi. Note the intense density of the shadows. This is characteristic of late calcium phosphate urolithiasis. Such stones are best treated by open surgery. If the condition is unilateral, nephrectomy is indicated. If nephrectomy is contraindicated, combined pelvic and nephrolithotomy, followed by irrigation therapy, is indicated See figure 7. This was done in this case with good results on the right side. The left side is to be done at a later date.

This was an instance of extensive late hard calcium urolithiasis without infection. No precipitations were found in the tubules on microscopic study. If bilateral stones had been present this would have been a perfect case for nephrolithotomy with postoperative irrigation therapy.

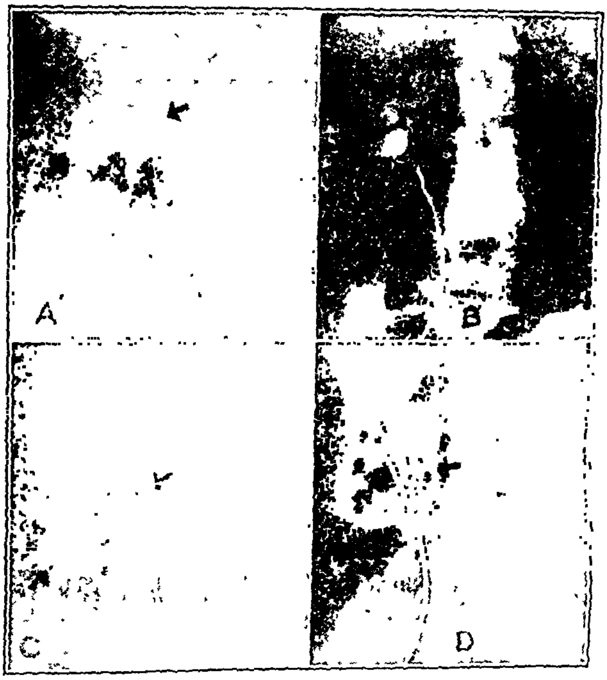

Fig 6 (case 7)—*A*, appearance at time patient was admitted to the hospital; *B*, plain film showing condition three days later, when irrigation had been going for two days; *C*, plain film on April 2, after twenty days of irrigation therapy. *D*, air pyelogram on April 16, thirty-four days after the institution of irrigation therapy. The stone has completely disappeared and the kidney infection is completely cleared up.

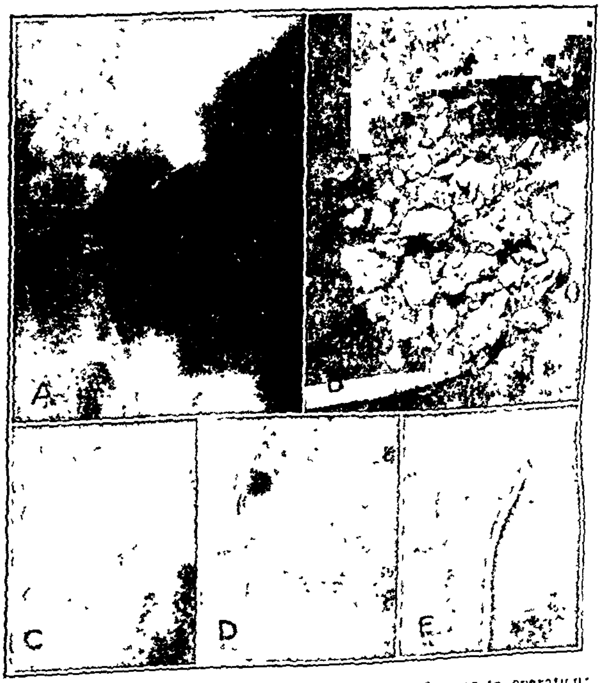

Fig. 7 (cases 8 and 9).—*A*, appearance in case 8 prior to operation; *B*, fragments removed through pelvic incision *C*, condition in left kidney in case 9 prior to operation; *D*, plain film with stone shadows remaining after operation and prior to irrigation therapy; *E*, plain film illustrating condition after four months of irrigation therapy; the fragments have all disappeared.

Case 5 (fig. 4).—A white man aged 39 was admitted on Nov. 9, 1944 with a long history of recurring left perirenal abscess formation following a gunshot wound in that region in 1936. He now is chronically ill with tenderness over the region of the left kidney. The urine is alkaline and badly infected. Films reveal a normal right urinary tract and a nonfunctioning calculous pyonephrosis on the left side. Left nephrectomy was performed on November 13 with excellent postoperative result.

CASE 6 (fig. 5 *B* and *C*).—A white man aged 33, admitted to the University Hospital on Feb. 8, 1940, had a story of having an appendectomy in May 1939 with postoperative retention necessitating many catheterizations. These were followed by evidences of urinary tract infection. Symptoms on admission were aches and pains in the left upper abdomen. Physical examination showed definite evidence of a moderate chronic prostatitis and some pus in the left kidney urine, which was alkaline and showed Proteus vulgaris on culture. The plain film, *B*, showed the calculus as described in the upper calices of the kidney. *C*, the intravenous pyelogram, showed no deformity of the kidney pelvis and good function of the kidney. The findings and the history were typical for early calcium phosphate renal lithiasis. With our present knowledge of this condition and with the improvements in the technics of irrigation therapy, irrigation therapy would have been carried out in this case. However, at that time, February 1940, a left nephrolithotomy was decided on. The left kidney was exposed, and this appeared essentially normal. The stone, which was found to be really a cast of the upper calix, was soft and mushy, and part of it stuck to the tips of the calix. It broke into many small fragments when an attempt was made to remove it. Because of this and because of hemorrhage from the kidney substance, nephrectomy was decided on and performed. The postoperative recovery was excellent, and the patient has continued to be in good health. Microscopic study of the removed kidney showed this to be essentially normal except for a mild chronic inflammatory infiltration adjacent to the epithelium which had been in contact with the stone. There was no evidence of calcium precipitation in the tubules.

TABLE 2.—*Preventive Treatment of Calcium Phosphate Urolithiasis in Patients Who Are Extensively Immobilized Over Long Periods of Time*

Measures	Accomplishes	Comment
1. Maintenance of large fluid output	a. Counteracts stasis by producing a steady flow of urine b. Diluted calcium concentration especially important during period of hypercalcinuria (first 6 to 12 weeks of immobilization) c. *Minimized likelihood of infection* d. Washes out débris and small calcium precipitates	a. Measure intake and output carefully; remember in cases of neurologic involvement that residual urine may cause inaccuracy in output measurement
2. Control of diet High vitamin A and B acid ash diet usually used	a. High vitamin A and B improve epithelial nutrition b. Increase acidity of urine; calcium phosphate is more soluble in an acid than in an alkaline urine	a. Check urinary p_H daily with nitrazine paper b. Discontinue acid ash diet if urine remains alkaline from any cause such as infection with urea-splitting organisms
3. Control of stasis a. Movement of patient b. Provision of adequate drainage by catheter or surgery if necessary c. Maintenance of a large fluid output	a. Makes sure that no portion of urinary tract is dependent or undrained for too long a time b. Minimizes infection c. The use of a catheter makes possible irrigation of pelvis or ureter with special solutions such as citric acid and malic acid solutions	
4. Control of infection a. Maintenance of large fluid output b. Adequate drainage c. Chemotherapy: 1. Sulfacetimide 4 Gm. daily in drug of choice 2. Sodium sulfathiazole 4 Gm. daily 3. Other sulfonamide 4 Neoarsphenamine 0.3 Gm. two times weekly in some staphylococci infections 5. Penicillin, very useful	a. Decreases particles in urine (pus and epithelial débris, which may act as nuclei for stone formation) b. Infection with urea-splitting organism produces alkaline urine, which causes precipitation of calcium phosphate	a. Watch urine p_H with nitrazine paper b. Study centrifuged urine specimen daily for pus cells
5. Continuation of treatment for 3 months after immobilization has ceased	To remove any small precipitation which may have formed during period of stasis and hypercalcinuria	
6. Frequent radiographic check-up examinations during illness and every 3 months for one year after immobilization has ceased	This is very important; small precipitates may not be visualized in early urograms but may be visualized later after they have grown; many stones (especially in patients with neurologic lesions) may be silent for years and thus produce irreparable renal damage unless they are visualized by x-ray examination and treatment instituted	

Note: Henline has shown that the emptying time of the renal pelvis is greatly increased by a small urinary output and decreased by a large fluid output (Lowsley and Kirwin: Clinical Urology).

Case 7 illustrates (1) the appearance of a staghorn calculus in the right kidney associated with immobilization due to generalized atrophic arthritis, (2) the typical x-ray characteristics of relatively early calcium phosphate renal lithiasis—lack of density in most of shadow, the following of the configuration of the calices, and absence of evidence of infection, and (3) the dissolution of a staghorn calculus by ureteral catheter irrigation with citric acid and malic acid solutions with magnesium oxide.

CASE 7 (fig. 6).—A white woman aged 56, first seen in the University Hospital in 1937 with generalized atrophic arthritis, showed little improvement on treatment for this. She was admitted on March 12, 1945 for a check up examination. A plain film showed extensive cholithiasis and a staghorn calculus in the right kidney. The pyelogram on the left side was essentially normal. The urine had a p_H of 7.0 and a moderate number of pus cells per high powered field, with a mixed infection with colon bacilli and staphylococci. An indwelling ureteral catheter was put in place and the patient given forced fluids, penicillin therapy and irrigation therapy through the ureteral catheter on alternate weeks with citric acid magnesium oxide and Zephiran and malic acid magnesium oxide and Zephiran solutions. The results are shown in figure 6.

Cases 8 and 9 illustrate combined nephropelvic lithotomy and large staghorn calculi followed by irrigation treatment to remove any fragments of stone remaining. The problem of complete removal of remaining fragments in such cases has been a bugbear because of extreme renal damage caused by many nephrotomies in order to remove all fragments. By means of postoperative irrigation therapy this difficulty has been overcome in many cases.

Case 8 (fig. 7 *A* and *B*).—A white man aged 48 entered the hospital on Jan. 3, 1945 with a long history of urethral stricture and intermittent attacks of pain and renal infection on the left side. Physical examination showed the presence of a small stone in the lower calix of the right kidney and a large staghorn calculus in the left kidney with bilateral renal infection. On January 12 pelvionephrolithotomy was carried out. In order to avoid large incisions through the kidney substance and thus preserve as much renal substance as possible, the stone was broken up through the incision in the pelvis with a strong forceps and *B* illustrates the fragments removed through the pelvic incision. *A* shows the plain film taken prior to the operation. Following this procedure a nephrostomy tube was left in place and a continuous drip of 0.25 per cent acetic acid solution was alternated with citric acid magnesium oxide solution. The patient left the hospital on February 7. The incision was well healed, and no fragments were remaining that could be demonstrated on the x-ray film. The kidney was functioning on the intravenous pyelogram. He had in the meantime passed the stone from the right kidney.

Table 3.—*Treatment of Patients with Calcium Phosphate Renal Lithiasis*

1. All measures outlined under Preventive Treatment of Calcium Phosphate Urolithiasis in table 2
2. Institution of adequate drainage:
    a. Urethral catherization
    b. Ureteral catheterization
    c. Nephrostomy
    d. Pyelostomy
3. Irrigation of urinary passageway with antiseptic and "dissolving" solutions to control infections and dissolve and remove fragments of stone
    Valuable solutions are: 0.8 per cent sulfanilamide solution
    0.25 per cent acetic acid solution
4. Avoidance of pseudorecurrence
    When removing multiple stones or a branching stone, x-ray check-up during the operation is of great value in preventing a small stone from being left behind
5. Calicectomy and other operative procedures on urinary tract to correct acquired or congenital urinary stasis
6. Surgical lithotomy, or nephrectomy

* Citric acid (monohydrous)	32.3 Gm.
Magnesium oxide (anhydrous)	3.8 Gm.
Sodium carbonate (anhydrous)	4.4 Gm.
1/20,000 aqueous Zephiran q. s. to	1,000 cc.
† Malic acid	32.3 Gm.
Magnesium oxide (anhydrous)	3.8 Gm.
Sodium carbonate (anhydrous)	4.4 Gm.
1/20,000 aqueous Zephiran to	1,000 cc.

Proportions of acid to sodium carbonate can be changed to raise pH and thus lessen irritability if this is present (see Hodge, et al).

* Citric acid solution in 1/20,000 Zephiran.

† Malic acid solution in 1/20,000 Zephiran.

Case 9 (fig. 7 *C, D* and *E*).—A white woman aged 54 was seen in conjunction with Dr. A. G. Fleischman of Des Moines, Iowa. She had a long history of bilateral nephrolithiasis and ureterolithiasis. When Dr. Fleischman saw her in June 1943 she had a stone in the lower calix of the right kidney and a large stone in the left kidney pelvis and several smaller stones in the lower calices of the left kidney pelvis. She was having symptoms of pain and infection on the left side. Dr. Fleischman exposed the left kidney and removed the large stone. Because of bleeding from the nephrotomy wound he was unable to remove the smaller stones, and he inserted a nephrostomy tube for drainage. The patient got along nicely and I saw her on June 31. At that time she was feeling well and she had at least four stones, the smallest about the size of a pea and the largest about 1.5 cm. in diameter, located in the left kidney pelvis. Irrigation with citric acid magnesium oxide solution was carried out intermittently through the nephrotomy tube. In four months the fragments had completely disappeared.

THE REMAINING TASK

MAJOR GENERAL NORMAN T. KIRK
The Surgeon General

While the Regular Army, of which I am an officer, furnished the nucleus of the Medical Corps, its civilian components did the professional work. Our role was necessarily organizational and administrative; the civilian physicians took over from that point. We issued the administrative directives and implemented the professional policies; the basis for them was established by the professional consultants who came into the corps from civilian practice, and they were applied by civilian physicians. Credit for the results, therefore, rightly belongs not so much to the methods which were employed as to the men who employed them.

In 1940, just after the fall of France, the United States Army consisted of approximately 250,000 men and the Medical Department of about 1,600 officers, of whom about 75 per cent were in the Medical Corps. By Dec. 7, 1941 there were 1,613,000 men in the Army and 11,390 officers in the Medical Corps. On V-E day there were some 8,300,000 men in the Army and some 47,000 officers in the Medical Corps. The increment in the Army was chiefly by way of Selective Service. The increment in the Medical Corps consisted entirely of volunteers. I should be less than fair if I did not pay tribute to the physicians who served at home and, in particular, to the 33,000 who voluntarily and without recompense manned the Selective Service boards all over the country.

The American armed forces had better medical care in World War II than the soldiers of any army ever before received. More men were saved from death, more men were returned to military usefulness and more men were spared suffering and mutilation and disfigurement than was dreamed possible at the end of World War I or, for that matter, at the beginning of World War II.

In the magnitude of our task we inevitably made mistakes. Some men were given too much rank for their qualifications, and some men, many men, had far too many qualifications for their rank. As the war progressed, and as classification of medical officers according to their abilities and training became more accurate, many of those errors were corrected. Even if they remained uncorrected they were always honest errors, which arose chiefly from miscalculations and from human frailties of judgment.

Inevitably also in many instances we used our sparse military personnel uneconomically. Part of the wastage occurred because war itself is wasteful. Part of it occurred because the provision of medical care during wartime must be guided by the exigencies of battle and by strategic demands. In other words, the medical effort is always ancillary to the fighting effort. If you will recall that the preparation for D-day took well over a year, that the staging for the invasion occupied something over twelve weeks and that medical units had to be prepared and had to stage along with the fighting units, you will understand why, for long periods of time, a certain proportion of our professional skill was incompletely utilized.

Many instances of wastage were apparent rather than real. I think, for example, of a hospital with a 90 bed capacity on the coast of Delaware. We tried always to keep a highly competent surgeon there, though his

---

Read at the annual dinner of the Society of Surgeons of New Jersey, Plainfield, N. J., Jan. 30, 1946.

services were never fully utilized. But that particular hospital was part of a coast artillery station at the mouth of a river which has been described as the most heavily mined 18 miles in the world. It also served an air field a few miles away where navy pilots practiced blind night landings in preparation for night carrier landings. We still try to keep a highly competent surgeon at this hospital. At present the mines at the mouth of the river are being removed and detonated, and I am told that that process is more dangerous than laying them. Moreover, the Coast Artillery personnel is now conducting experiments with 16 inch guns. Neither during the war nor since have there been any serious accidents at that particular station, but the potentialities continue to exist and we must continue to be prepared for what might happen there, just as we were formerly prepared for what might have happened.

I know that civilian physicians do not take kindly to the regimentation of the Army. One of our most delicate problems was and still is to strike a balance between the man who keeps enough of his native independence to be a usefully aggressive officer and the one who keeps so much that he ceases to be useful at all to the Army.

Regimentation is usually much less arbitrary than it seems. Early in the war large numbers of operations were performed for such conditions as internal derangements of the knee, herniated vertebral disks, varicose veins, varicoceles and pilonidal sinuses. In army parlance these conditions were classified as EPTI, that is, existing prior to induction. Within a year operations for most of them had been stopped by directives from the Surgeon General's Office. Men with these conditions either served with them, on limited service if necessary, or were separated from service because we had found, by painful experience, that in attempting to correct them we were creating a host of other problems. Pilonidal sinus is the outstanding illustration. The technics for its correction are multiple and are correspondingly unsatisfactory. They proved even less satisfactory in the Army than in civilian life. In the first nine months of 1942 in twenty hospitals of a single service command there was an estimated loss of 30,000 man days as the result of surgery for pilonidal sinus alone. Multiply that loss by nine service commands and you will understand why a directive was issued forbidding elective surgery if the condition was symptomless and permitting only incision and drainage if the sinus or cyst had become infected.

CARE OF THE PARAPLEGIC

Against these confessions of difficulties and errors—and if time permitted I could, of course, make many more—let me describe an achievement which I think you will agree compensates for many errors. The program for paraplegics concerns only a relatively small number of men, but to me it is a shining example not only of the professional competence of the physicians who served and are serving in the Army but even more of their humanity.

Until this program was instituted, men with spinal cord injuries and resulting paralysis were regarded as hopeless invalids, and I fear that they were treated as such. That attitude has been completely reversed by the Army Medical Corps, which met the problems of this injury with all the resources of the profession.

First, operation was performed promptly in all proved or suspected cases of spinal cord injury, chiefly because exploration proved to be the only sure way of determining whether or not the condition could be relieved surgically. The operations were done only by skilled neurosurgeons, and the risk was incredibly small; thirty-two consecutive operations were done at one hospital, for instance, without a fatality. Operation was also done promptly; in one reported series 57 per cent of the patients showed improvement when they were operated on within five days after their injuries, against only 10 per cent when operation had been deferred beyond this period.

As soon as possible after wounding or operation the men were evacuated to the Zone of the Interior, where they were concentrated in nineteen special centers, again under neurosurgical direction. The next phase of management, however, was chiefly urologic. Suprapubic cystostomy had been done in all such cases before evacuation. Now the problem was to substitute a urethral catheter for the suprapubic catheter and then to establish a reflex bladder, which was usually accomplished by the institution of tidal drainage, and to prevent (or correct) urinary infection while these objectives were being achieved. Technic is no part of my story, but I do want to emphasize that this was the urologist's day and that he had specially trained corpsmen to help him, one or more of whom were constantly on duty in every paraplegic ward. No untrained attendant ever participated in the care of a paraplegic's bladder.

It was also the urologist's function to see to it that urinary calculi did not develop or that they were treated without delay if they had developed. Since stones have been reported as early as one month after recumbency, patients were investigated from this angle as soon as they reached Zone of Interior hospitals. By prophylactic and conservative measures, in which such a simple but time-consuming procedure as frequent changes of position played a highly important part, most patients were kept free of stones, and with negligible exceptions stones which had already developed were eliminated without operation.

As to decubitus ulcers, patients who arrived in the Zone of the Interior with pressure areas properly protected seldom developed them here because every possible measure was employed to keep them free of this complication, frequent changes of position again being the most important part of the regimen.

Ulcers which had already developed furnished a major problem. They were usually multiple. At one center 130 ulcers were at one time under treatment in 45 patients. At another center 10,000 dressings were done in one month for this cause alone. Some lesions measured from 6 to 8 inches in diameter and involved the entire sacral area.

Ulcers were vigorously attacked from every angle by such obvious measures as support of pressure points, frequent changes of position, scrupulous attention to cleanliness and unremitting endeavors to keep the patient dry, and by aggressive surgical efforts to close the wounds by the principles of plastic surgery. These measures were estimated to have saved from six to twenty-four months of treatment in some cases. Not infrequently they saved life.

Perhaps the most important advance in the management of decubitus ulcers was the discovery of the enormous loss of protein by this route. In some instances the measured loss was as high as 50 mg. daily, and reversal of the albumin-globulin ratio was frequent. To attain a zero balance under these circumstances, let alone a positive one, was no simple matter.

It required the introduction into the patient of 150 to 175 mg. of protein daily. Whole blood and plasma were useful in emergencies, but the long-term solution of the problem required that most of the protein be introduced by way of the diet in a readily assimilable form. In such cases the internist took charge, and dietitians, under his direction, became responsible for individual patients.

Finally came the matter of ambulation. We did not deceive ourselves about that. Ambulation is beyond the capacity of all but a few paraplegics. But ambulation in the sense of getting about by braces and crutches sufficiently to care for themselves, is a definite possibility for most patients with cord lesions at or below the tenth dorsal vertebra and is a more guarded possibility for patients with lesions below the second dorsal vertebra. In lesions above that level ambulation is not possible, but a wheel-chair existence is.

In other words, so far as this program was concerned, a bedridden patient was simply not conceived of. When a man reached a paraplegic center it was taken for granted that he would be out of bed promptly, or at least as soon as certain physical deficiencies had been corrected, and that he would attempt to walk with equal promptness. An unexplained neurologic, vascular, cardiovascular and nutritional improvement always occurs when these patients begin to move about. Passive exercise is not a substitute for early attempts at ambulation and was never so regarded. To get the patient out of bed and on his feet was the goal in every paraplegic center for every man treated in it. We hitched our wagon to the stars, and we got where we were going in a surprising number of cases.

There has been nothing like these results in the previous history of neurosurgery; they were achieved against untold odds. The urologic care of the paraplegic is a never ending struggle against infection. Instruction in ambulation is tedious and difficult for instructor as well as for instructed. The care of decubitus ulcers is often a loathsome task, and the details of their prevention are endless. But in these army centers these difficulties were overcome by the unified efforts of neurosurgeons, plastic surgeons, orthopedic surgeons, urologists, internists, nutritionists, nurses, dietitians, physical therapists and hospital corpsmen.

The neuropsychiatrist was naturally called in when he was needed, but most of these patients were not neuropsychiatric and they were not permitted to become so. One reason was that they were kept busy. They were taught printing, woodwork, radio repairing, watch repairing, typewriting, photography and similar occupations at which even a handicapped man can do a day's work and by which he can earn a decent living. Finally, their domestic and family relationships were kept on an even keel.

The care of these patients was based above everything else on the preservation of sound morale. Every person who came into contact with them played his part in its preservation, but the keystone of the arch was the ward physician. He integrated every detail of supervision and management. He could not himself do for them everything that was done, but there was no detail of their care which he did not know intimately. He made regular ward rounds, of course, but he also went around on Sundays and holidays, and at odd times during the day and at night, and he became the confidant and friend of the men as well as their medical adviser. I doubt, indeed, if the doctor-patient relationship which developed in these wards has ever been equaled in the history of medicine; I am sure that it has never been surpassed. When a paraplegic patient was concerned, the ward physician never took no for an answer.

At one paraplegic center a young first lieutenant for six months, without other help, served as ward officer for 109 paraplegic patients in forty-seven different rooms. Christmas came soon after he was put in charge, and because he had imagination and sympathy as well as medical ability he went to the commanding officer with the suggestion that the men be permitted to have their families in with them for Christmas dinner. The commanding officer, I presume automatically, said no. Said the young officer—who had been an officer only four months—"I demand that these men have their families for dinner. They may not be here next Christmas. They have given everything for their country. They deserve to have their families with them on Christmas, and damn it, they are going to!" They did have them, and no one in the hospital had more to do with the success of the dinner than did the commanding officer. When a ward physician carries the ball for his patients in that manner—men have been court-martialed for less—you can readily understand why the morale in paraplegic wards, which was formerly the worst in every hospital, is now much the best.

OTHER TASKS

This program illuminates much of our remaining task. At the end of August 1945 there were 312,000 patients still in hospitals. At the end of December there were 180,000, 1,400 of whom were paraplegics. By next June it is estimated that there will still be approximately 70,000, of whom at least 600 will still be paraplegics.

Add to those paraplegics other categories of patients who also present special needs. At the end of November there were 11,350 patients in the nine centers set aside for plastic and hand surgery, who, it was estimated, still needed almost 31,000 operations. The plastic surgeons who had been working twelve to fourteen hours daily six days a week to carry this load were most of them eligible for separation on points. We froze them in the Army. I explained to them why we had to do it. They understood, and they are still doing their job. So are the physicians who are taking care of the 5,000 neuropsychiatric patients now in the hospital, 2,000 of them in closed wards, and the 1,000 patients with tropical diseases, the 1,800 with tuberculosis, the 300 blind men who are being rehabilitated and the thousands of other casualties of the war who, by the orders of the Chief of Staff, the Secretary of War, and the President of the United States, must not be discharged to civilian life or transferred to the Veterans Administration till army doctors have done for them all that modern medical science and skill can do.

The casualties of war, however, are only part of our medical responsibility. In view of the current agitation concerning demobilization I think it particularly important to emphasize our other tasks. I do not shut my eyes to the discontent which I know many medical officers must feel with the working of the army discharge system; though I am glad that the near hysteria which has afflicted some portions of the service has been notably lacking in the Medical Corps. I should be the last to claim that the system itself is perfect. I think it fair to emphasize, however, that even a perfect system cannot be perfectly applied and that individual exceptions, even though in most cases the exception will be found, on investigation, to be more apparent than real, always make for bitterness. I realize fully that the system has been particularly unfair to doctors, and particularly to doctors who are critical specialists. For most of them it has simply been abrogated. Points or no points, we had to keep them in service.

As General Eisenhower explained to Congress recently, demobilization has in general proceeded so successfully to date that two incompatibles have met head on sooner than had been expected, the speed of demobilization and the cold, hard facts of the commitments and obligations which this country has assumed both at home and abroad. Let me outline them in brief as the Chief of Staff described them in detail. They include: Occupation duties in Germany, Austria, Japan, Korea and certain Pacific islands. Supervision of government in enemy countries suffering from wartime devastation and shortages. Demolition of fortifications and other installations, including war-making potentials, of which 3,000 must be destroyed in Germany alone. Policing of international boundaries, of which there are 2,000 miles in Germany alone. Guarding of military stores, bridges, communication systems, electric installations and anything else which might be sabotaged. Construction and maintenance of transportation and communications systems. Constant surveillance of enemy populations, with the rounding up of war criminals still at large and the suppression of crime, which in Germany, at least, is rampant. Provision of emergency supplies of food and other stores for enemy countries. Maintenance of law and order in such friendly countries as the Philippines, which are not yet prepared to take over this task. Registration of the graves of the United States soldiers and sailors who died in action overseas. Supervision of prisoners of war in conquered countries and in the United States. Operation of air transport in all enemy countries. Operation of centers for displaced persons, of which there are 365 in Germany and 85 in Austria. Protection not only of captured matériel but of billions of dollars' worth of United States property all over the world, including such areas as Burma and India, in which we have no occupation duties. Operation of induction centers in the United States and conduct of the training of newly inducted soldiers both at home and overseas. Operation of camps, posts and other installations, such as staging areas and ports of debarkation in this country and overseas. Processing of separated personnel in the United States. It would be, said General Eisenhower, a final burst of irony to separate trained personnel (who have the points for separation themselves) serving at the separation centers and thus further delay large-scale demobilization.

These tasks, the Chief of Staff concluded, were assigned to the Army by Congress, and only competent authority, presumably Congress, can remit them. Some of them necessitate constant activity. Some of them require little more than the presence of troops against a potential emergency. But you do not, he concluded, send the firemen home when you pass a firehouse and see them with apparently nothing to do but play checkers.

No more can you send the doctors home under the same circumstances. General Eisenhower did not specifically mention the Medical Corps in the course of his remarks to Congress, but naturally he did not have to. Wherever American soldiers are on duty anywhere in the world, there must medical officers be with them. The flow of battle casualties has mercifully ended. But young men are still subject to all the usual diseases, from colds in the head to acute appendicitis. They are still subject to accidents, some of them inherent in their dangerous tasks, some of them, as an English physician caustically put it, arising from "the stupidities of fools." They still must be protected against tropical diseases. They still must be protected from the diseases born of wartime devastation and malnutrition. They still must be looked after at staging areas and on their way home. They still must be examined most thoroughly at separation centers, both for their own sakes and for the sakes of the taxpayers who will later foot the bill for errors as well as for genuine disabilities. Those who will replace them at home and overseas must still be examined at induction centers. Prisoners of war must still be cared for. Displaced persons are frequently medical problems before they are anything else.

In short, the Medical Corps can no more be permitted to fall apart, to "demobilize by demoralization," than can the rest of the Army. The physicians in civilian life would no more wish that to happen than do the physicians still in uniform. All military service, as has been well said, entails some hardship. The hardship to be borne by men who must remain in uniform longer than they like is simply an essential part of what has gone before. It cannot be evaded without placing in jeopardy the victory so arduously won in combat. It is indispensable to the completion of the job.

MEDICAL EDUCATION IN EUROPE

WILBURT C. DAVISON, M.D.
Durham, N. C.

European medicine has gone through a series of cycles, various countries taking the lead for one or more generations and then through the effect of wars or national pride falling behind, i. e. Egypt, Babylon, Greece, Rome and Italy in succession during the old days, and France, Great Britain, Germany and the United States during the last century. This rise and ebb of medical leadership should warn us that we may be at a dangerous peak and that either we must continue to climb or we shall fall like the others.

In the nineteenth century, medical schools were of three types: clinical, university and proprietary.[1] In France and Great Britain the type was clinical, having grown out of the hospitals. However, in France the preclinical sciences fared badly, while in some, though not all, of the British schools general advances occurred in all the medical sciences. The university type of medical school prevailed in Germany, Denmark, Sweden, Norway, the Netherlands and German speaking Switzerland, largely on a lecture basis. Most of our own schools of that period were proprietary.

From the Department of Pediatrics, Duke University School of Medicine and Duke Hospital.

Read before the Forty-Second Annual Congress on Medical Education and Licensure, Chicago, Feb 11, 1946

This report is based on three years as a medical student at a British university before and during World War I, seven summers between Worlds Wars I and II visiting European pediatric clinics, being able to spend this past summer in England and Germany through the kindness of Major Gen Morrison C. Stayer, Brig Gen James Stevens Simmons and Col Thomas B. Turner, and last but not least conversations last summer in London and last week in Durham with Dr Daniel P. O'Brien, who represents the Rockefeller Foundation in Europe. The observations of Major H. M. Rozendaal, Capt J S Lichty and Dr E Y. Hartshorne, whom I accompanied on their survey of schools in the U. S. Zone of Occupation, also have been very helpful.

[1] Flexner, A: Medical Education in Europe, Bull 6, New York, Carnegie Foundation for Advancement of Teaching, 1912; Medical Education: A Comparative Study, New York, Macmillan Company, 1925. Rappleye, W. C.: Final Report of the Commission on Medical Education, New York, 1932.

The evolution of medical education started with the twentieth century in Europe and with the 1915 purge in our own country,[2] and these three types of medical schools became less distinguishable. By the end of World War I, all medical students received more or less instruction in the whole gamut of medical sciences from biology to psychiatry and public health. Except for France, in which clinical work is done in the first year, the curriculums at all European and British schools are much the same, starting with the premedical sciences and continuing five to seven years.[1] In one respect this schedule is better than ours, namely that the medical school either is responsible for premedical education, as at St. Bartholomew's, or controls it through examinations, as in the rest of Europe. American medical students would have a far more useful premedical preparation than is furnished at present by many of our colleges and universities if it were supervised by the medical schools.[3] Ours is the only country in the world in which premedical education is unsupervised.

Although the curriculums were more or less similar, medical education in the various European countries differed tremendously during the lull between World Wars I and II. It was good in Scandinavia, the Netherlands and Switzerland, variable in Great Britain and much lower than ours in the other European countries. Obviously, factors other than the curriculum are responsible, the three most important being the faculty, the students and the type of teaching. In the countries in which medical education is good the faculty is appointed on merit and the students are selected, rarely exceed one hundred in a class and learn "by doing" through practical laboratory and ward work. The following alphabetical survey is, like politics and religion, open to argument, and I hope that it will produce discussion helpful both to European and to American medicine:

Belgian medicine suffered from Flemish and Walloon squabbles and lacked a national medical policy. Except for several former CHB fellows and an occasional Nobel prizewinner, Belgium has little with which to rebuild. However, 150 Belgian scientists have recently been sent to Great Britain for study.

Medicine in the prewar Balkans was very poor. In Bulgaria and Yugoslavia it was largely Austrian, and in Rumania it was under French influence. In the other two countries little is known of their postwar plans, but in Yugoslavia, Stampar, a former Rockefeller and Flexner fellow, is being helped by Tito to establish public health and medical education.

Czechoslovakia has liquidated the German medical school in Prague, although before the war it was better than the Czech school. The future seems grim, for many of the Czech teachers were killed.

Denmark has been said to be a perfect state medically.[4] It is small enough to control all of the factors which tended to ruin medical education in many of the larger countries. The public health program and the Serum and Carlsberg laboratories are the envy of many nations. However, outside contacts are now necessary to remove the putrefaction of the German invasion and occupation.

Iceland, a former Danish possession, or vice versa, has fared better, as the Rockefeller Foundation provided fellowships for several physicians from Iceland during the war.

Little information is available on the present condition of the medical schools of the Baltic states Estonia, Latvia and Lithuania. Before World War II several former Rockefeller fellows had helped raise medical standards.

Between World Wars I and II the medical school at Helsinki, Finland, was of the usual Scandinavian excellence, but no news of its present state is available.

Medical education in prewar France, largely because of the mobs of unselected students, was a disgrace to Louis, Laënnec and Pasteur. French medical education worsened during the German occupation, and now the French government is making an effort to improve standards. With the assistance of the Rockefeller Foundation fifty young French medical teachers are being maintained at several medical centers in this country.

Germany is a typical example of the European countries in which medical education has not kept pace with the advances in medicine, and therefore the situation is described in more detail.[5] There were at least four reasons for the low state of German medicine: 1. Too many students with little or no selection; of the 6,000 total university students at prewar Munich, 4,000 were medical! Part of this overcrowding was due to state support, which made rigid selection politically difficult, but more of it was due to the payment of the faculty on a "per student" basis. The larger the country's population, of course, the harder it is to keep the classes small. 2. Arrogant self satisfaction with the status quo prevented improvement. 3. Some of the faculty were replaced by worthless Nazi party members. 4. All of the teaching was by lectures without adequate laboratory and clinical work. In none of my tween-war visits to the German and Austrian pediatric departments did I see a medical student in the wards. Czerny, Finkelstein, Pirquet and the others would spend hours "walking the wards" with their assistants and visiting foreigners, but their only contact with students was a lecture or demonstration in the Hörsaal. They could see no reason why students should be taught bedside medicine. They had never heard of Osler's statement that the epitaph he wanted was "He brought medical students into the wards."

Furthermore, the segregation of research workers from the medical school into Kaiser Wilhelm institutes has reduced the productiveness of German medicine so that the medical journals for a generation have been of little scientific value. Except for the malarial treatment of dementia paralytica by Wagner-Jauregg, the insulin shock therapy of psychoses by Sakel, cellular metabolism by Warburg and thoracoplasty by Sauerbruch, nothing has been produced by Germans and Austrians since 1912 comparable to their pre-World War I medical contributions or to the current discoveries of American and British investigators, of which the Germans are contentedly ignorant. As an example of this attitude, Kuhn, a biochemist at the Kaiser Wilhelm Institute at Heidelberg, told us that he had an epoch making antiseptic. We asked if it was equal to penicillin. He promptly replied that it was better. He then had to admit that he had not compared them, but he said that anyway he knew that his drug was more powerful!

Fittingly, the war had the worst effects on medical education in Germany and Austria. As already mentioned, their pre-World War II educational standards were low but now, except for the intact medical schools of Heidelberg, Marburg and Erlangen in the U. S. Zone of Occupation, Göttingen in the British area and Tübingen in the French zone, the physical facilities of most of the other twenty-four universities[6] are 50 to 80 per cent destroyed. At Göttingen the war actually improved medical education by destroying the large lecture room so that instead of admitting 800 first year students as usual, the class had to be limited to 150. However, the faculty of medicine did not agree with us that this limitation and consequent possibility of improving instruction more than offset their personal reduction in student fees. The other German medical schools have improvised usable accommodations for the hospital care of patients in their communities, but their facilities for teaching are inadequate.

Nevertheless all of the German and Austrian medical schools, which had been closed since the invasion in April 1945, petitioned their respective military governments for permission to open, largely, as they freely admitted, so that the faculty might receive salaries, and the students receive ration cards without working in the fields or labor battalions. The students seemed to have plenty of money to pay tuition because there are no consumer goods to be purchased with their savings from war wages or army pay. The immediate German problem, just as it is in this country, was to provide postgraduate instruction for the returning medical veterans. Starting at Heidelberg on August 15 and at Marburg on September 3, 337 and 160 graduates, respectively, were given typical German teaching with lectures from 8 a. m. to 5 p. m. with two hours for lunch. The members of the German faculty were deaf to our suggestion that these ex-medical officers should be taken into the wards and into the laboratories. "Why should they? It isn't done that way here" was the stock answer we received.

The next question was How should the German medical schools be opened for regular sessions without any changes, which is what the Germans wanted, or to try to elevate the standards, which is what the Americans and British were willing to do if the Germans could be persuaded that they needed improvement? The members of the faculties of the British medical schools with whom I talked in London and Oxford en route to Germany, the American teachers of my acquaintance and I would have liked to be invited by the German medical school faculties to help install a modern program, especially the sponsorship of each German medical school in the U. S. zone by some American medical school, which probably, if invited, would rotate some of its faculty members to the German school so that modern teaching methods could be established and maintained.[7] However, among the medical teachers with whom we talked last summer only one, F. Volhard of Frankfurt, wanted to make any changes; he appreciated from his visits to this country the inferiority of German physicians and urged that the medical schools have only postgraduate courses to rehabilitate their present product rather than to create more poorly trained doctors. The other Germans paid no attention to him but went ahead with plans to produce more practitioners *en masse*. G. von Bergmann of Berlin listened while we talked about American advances in medical education but showed no interest. F. Sauerbruch did not even keep his appointment with us. While waiting in his library we found three copies of a German translation of Dr. Abraham Flexner's Medical Education, A Comparative Study, presented to him by the Rockefeller Foundation, but the pages were uncut! We left a note asking him to study the book. Karl H. Bauer's library at Heidelberg did not contain a single American or British book, yet he is supposed to teach modern surgery. When we criticized the low quality of German instruction, one of the members of the academic faculty at Heidelberg, not realizing or caring that we understood German, commented "It is odd to hear qualitative criticism from the land of mass production and record breaking figures." The German medical schools should be a warning to us not to let our pride in American medical education reach the point at which we are completely satisfied and are unwilling to try to improve it.

In spite of our pious hopes of helping the Germans improve their archaic medical instruction—a patient cannot be treated unless he realizes that he is ill—there was no alternative but to allow the Germans to work out their own problems after screening the faculties for Nazis, and to permit the universities to open without reorganization of their curriculums except for the elimination of Nazi ideology and teachers, and dangerous research activities—Heidelberg and other places had been busily engaged in atomic bomb studies. The university authorities were urged not to admit students in excess of the crowded housing conditions; if the city had been bombed there were few habitable houses and if it was intact, like Heidelberg and Marburg, it was crammed with homeless refugees from other cities. This advice, which was necessary for public health as well as for obtaining a desirable curtailment in student enrolment, went unheeded, and the regular session at Heidelberg started in November 1945 with 1,050 medical students, even though the physiology and biochemistry facilities, for example, could accommodate only 140. The equipment at Marburg was even less adequate, but 1,250 medical and dental students were admitted. Marburg has only thirty-three medical teachers and one dental instructor! With nothing but lectures, they may not need any more.

Of the other universities in the U. S. Zone of Occupation, Erlangen, Frankfurt, Munich and Würzburg are making plans for reopening later this year. The German land authorities, for financial reasons, have decided not to open Giessen. As a matter of fact, no one knows how postwar Germany can support any universities. However, those in the other zones of occupation have reopened or hope to do so in the near future under provisions similar to those in the United States area.

Medicine in prewar Austria was as bad as in Germany and for the same reasons. No postwar reformation seems likely. Hungary, on the other hand, had fairly good medical schools with reasonably sized classes and laboratory and ward teaching. No news is available on their postwar plans, but the Soviets probably have some.

In Great Britain, the variety of medical standards is responsible for the good and bad graduates—the M.B.'s from the universities of Oxford, Cambridge, London and Manchester, for example, being a different product from the L. S. A.'s. The Goodenough Report,[8] the numerous prewar Rockefeller Foundation fellowships and the eighty-six wartime medical scholarships will eventually raise British medical education to a uniformly better level. During the war the medical schools carried on fairly well, in spite of the bombing, by decentralizing the teaching to Oxford, Cambridge and other "provincial" towns. By demonstrating that a successful clinical medical school does not require a huge city and that a closer affiliation with a university is mutually advantageous, the war may have been of some benefit to British medical education. Thanks to the Nuffield Foundation and the war, Oxford now has a complete medical school, one of Osler's dreams. Before World War II most of the Oxford students went to London after they had completed their preclinical studies at Oxford. However, the Oxford academic faculty is perturbed over this invasion and is discussing its elimination.[9]

---

[6] Frankfurt, Giessen, Munich and Würzburg (U. S. zone); Bonn, Düsseldorf, Hamburg, Kiel, Cologne and Münster (British zone); Freiburg and Strassburg (French zone); Berlin, Greifswald, Halle, Jena, Königsberg, Leipzig and Rostock (Russian); Breslau and Poznan (Polish). In Austria the Russians also control Vienna, the British Graz, and the French Innsbruck.

[7] One of the reasons our diplomatic relations with other countries are so bad is our Anglo-Saxon spirit of reform, being missionaries and "do gooders," carrying the white man's burdens and always attempting to pull the mote out of other nations' eyes. It may be based on conceit and on a not too unconscious feeling of superiority. At any rate we are convinced that, if a political or medical program suits us, it must be imposed on every one.

Greece, because of politics and a poor faculty, has never had a good medical school.

Italy, the birthplace or rather the renaissance of modern medicine, has lost all claim to medical respectability. Before World War II, through the eighty-eight resident and the thirty to forty foreign fellowships supported by the Rockefeller Foundation, eleven of the twenty-three Italian medical schools were beginning to improve. However, Mussolini, a great increase in students, poor faculty salaries, the war and the deterioration of equipment killed this second renaissance.

In the Netherlands the isolation of the German occupation, the disappearance of 30 per cent of the faculty of medicine through death and liquidation, and the theft of books, instruments and machinery by the Boches, forced the closing of the schools at Leyden and Utrecht and the stagnation of those of Amsterdam and Groningen. Although prewar medical education in the Netherlands was equal to any other in the world, the Dutch are striving to reform and improve it. The government has invited four American medical teachers to spend three months in Holland as visiting lecturers. A delegation also is trying to rebuild the medical libraries.

The medical schools in Norway, though not physically damaged, have stagnated, as they have been cut off from the advances in medicine since 1940 and have not been able to graduate an adequate number of physicians. The temporary conquerors also stole considerable equipment. However, contrary to Germany, Norway believes in helping herself and is supporting forty dental students at Tufts, 320 science and medical students and 75 medical graduates in Sweden, Denmark and Switzerland. The American Scandinavian Foundation is trying to place others in this country. A special effort is being made to rebuild the public health and pediatric services.

Poland is in great medical need. Before World War II the medical schools of Warsaw and Cracow were nothing to be proud of, but now they are in ruins. During the war the Poles maintained a medical school in Edinburgh, and 30 to 40 were graduated last year. However, they do not seem to desire to return to Poland.

Prewar Spain, except for the neurohistologic laboratory of Cajal and Hortega in Madrid, had no medical education worthy of the name. Portugal is in a similar situation but without memories of Cajal and Hortega.

Sweden, before the war, had excellent medical schools at Stockholm, Lund and Uppsala,[10] but it now needs contact with the outside in order to resume its former standards.

Switzerland has maintained medical leadership in central Europe for many generations. While the medical schools in France, Germany, Austria and Italy deteriorated, Switzerland with good faculties, carefully selected small classes and practical teaching has been a model which all other nations should have followed.

The Union of Soviet Socialist Republics, like the United States of America, is an enigma for those who wish to generalize. The truth of the matter is that, like our own, some medical schools and parts of some others, e. g. the brain and physics institutes, are excellent, but the remainder suffer from too little mental and physical equipment. After all, the number of graduates cannot be greatly increased as it has from 1917 to the present without reducing some quality for the sake of quantity. The Soviets have invited thirty to forty American and British scientists to visit Russia, and a smaller reverse stream is starting.

SUMMARY

European medical education is not as good as most physicians formerly thought. It has been profoundly affected by the war both from the mental restrictions of the German occupation and from actual physical destruction in Great Britain, France, Italy and Germany. It is a great opportunity for us to be of help, but, as indicated, in connection with Germany our assistance must be invited. All of the European schools need supplies, and our army and navy medical surpluses now in Europe could not be better used than as gifts to the medical schols.

Several of the countries, e. g. Belgium, France and Norway, are sending their medical teachers to Great Britain and to this country for short or long periods of postgraduate training, and many others have expressed a desire not only to come here but also to remain. However, is this the best program for the rehabilitation of medical education in the countries that desire improvement? Scholarships and fellowships are splendid for the individuals holding them, and the number coming to this country is constantly increasing.[11] However, these people do not exert a very lasting influence on the university they visit or that to which they return, in spite of Colonel McCormick's fear that the Rhodes scholarships are part of a deep British plot to anglicize this country. Much more permanent effect would result if funds could be obtained to enable members of American faculties of medicine to spend three to six months at foreign schools to which they might be invited, as in the Netherlands plan, so that modern teaching methods could be established and maintained. A far better school of nursing was founded in Haiti by sending three teachers of nursing there than by bringing nursing students to this country. Oxford has profited by the Eastman visiting professors from this country, and the Flexner visiting lecturers from abroad have benefited Vanderbilt. It is said that even Harvard students like having visiting professors of medicine from other more provincial schools in this country—perhaps as a variation from their former Christian science.

PERINEAL PROSTATECTOMY UNDER CONTINUOUS CAUDAL ANESTHESIA

EDWIN DAVIS, M.D., and L. W. LEE, M.D.
Omaha

As long ago as 1931 one of us (Davis[1]) reported a consecutive perineal prostatectomy series totaling 229 under sacral block anesthesia without an anesthesia failure and had the temerity at that time to refer in the title to the "infallibility" of this method, properly employed, for this purpose. This consecutive series, now increased to a total well in excess of 1,000, has not yet been interrupted by failure, meaning that not in a single instance has it been necessary to employ supplemental inhalation anesthesia or narcosis of any kind except the routine preoperative hypodermic of ¼ grain (0.016 Gm.) of morphine sulfate given merely with the purpose of blunting the edge of apprehension. The term sacral block, as here employed, refers to injection of anesthetic solution through the sacral hiatus (caudal anesthesia), combined with injections through the sacral foramens, thus providing added insurance of success by approaching the same nerve roots from different directions (fig. 1). According to our routine technic, followed through the years, we have employed 40 cc. of procaine hydrochloride solution 1 per cent through the caudal needle and 10, 8 and 5 cc. into the first, second and third sacral foramens respectively on each side.

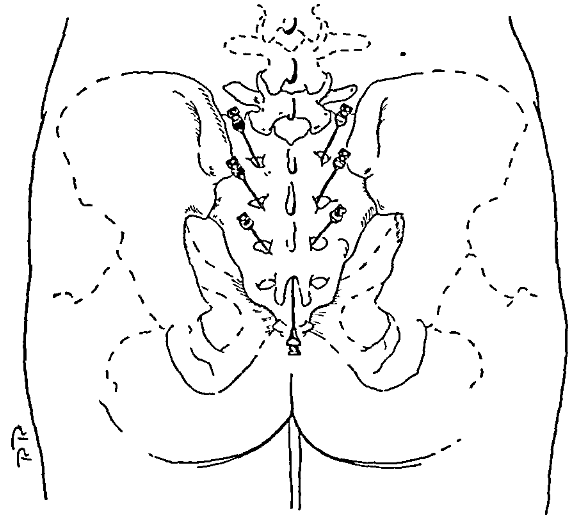

Fig 1.—Sacral block anesthesia, showing combined injection of sacral hiatus and foramens.

In view of this gratifying record, one might quite properly inquire why then attempt the continuous caudal method. There are several reasons, the first of which has to do with the skill and practice necessary for the location of the several sacral foramens, as compared with which the introduction of the needle into the caudal canal only is a comparatively simple procedure. This point is well illustrated by the published experiences of one of us,[1] whose early reports on perineal prostatectomy under sacral block anesthesia included no less than five anesthesia failures in the first twenty-five attempts, four in the second twenty-five, two in the third twenty-five, one in the fourth twenty-five and only one in the second hundred. The point which we make is that the dwindling percentage of failure is proof of the important role played by practice. All other factors having remained constant, this almost incredible improvement could have been due only to greater accuracy in the placing of the needles. From the point of view of the patient, the obvious advantage of the continuous caudal method lies in the difference between one needle and seven. There is also the time element, in that published figures[1] indicate an average period of eleven minutes necessary for the administration of sacral block anesthesia, with a maximum of thirty minutes and a minimum of four.

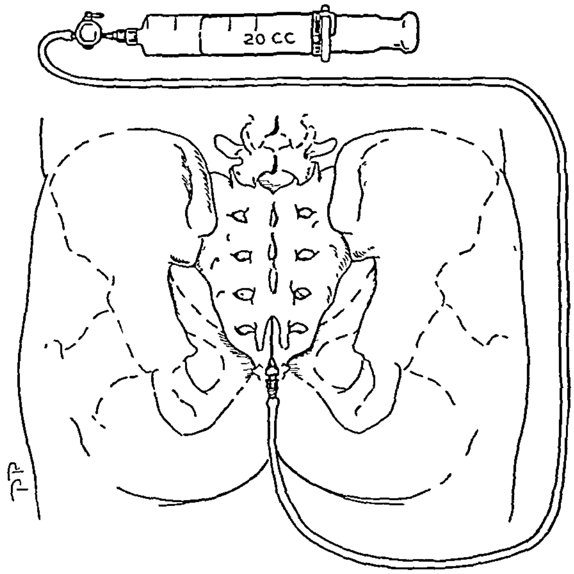

Fig 2.—Apparatus required for continuous caudal anesthesia.

Our chief justification however for investigating the possibilities of continuous caudal anesthesia in the perineal field was that this technic seemed to offer a simple and safe method of anesthesia of unlimited duration, permitting the operator to substitute deliberateness for haste, and applicable not only in cases of difficult perineal prostatectomy but also in such procedures as perineal fistulectomy, repair of urethrorectal fistula and Young's complete radical excision of early prostate carcinoma.

The principle of continuous anesthesia by intermittent administration during the operative procedure was introduced in 1940 by Lemmon[2] as continuous spinal anesthesia. Edwards and Hingson[3] in 1942 applied the principle of intermittent administration of the anesthetic agent through a caudal needle in obstetric cases with satisfactory results. The technic that we have employed in perineal surgery is essentially similar to the technic of Edwards and Hingson.

TECHNIC

With the patient in the prone position, a 3 inch malleable steel spinal needle, number 19, as described by Lemmon, is introduced into the caudal canal after infiltration of the skin and subcutaneous tissues through a fine hypodermic needle. Whereas, after years of satisfaction with a stiff needle, we had anticipated difficulty with the malleable needle, the contrary proved to be true, because of the tendency of the malleable needle to adapt itself to the normal curve of the sacral canal. Full advantage may be taken of the malleable

quality of the needle by combining the forward thrust with a slow twisting motion, thus causing the bevel to act as a sled runner and minimizing interference by the floor or the roof of the canal. Following attempted aspiration, to exclude the possibility of venipuncture, and the exceedingly remote possibility of spinal tapping, procaine hydrochloride solution 1 per cent, in the amount of 80 cc. is slowly injected. This amount was arbitrarily decided on because it was found to be adequate and harmless. It is not unlikely that a smaller initial injection would suffice. The patient is then placed on the operating table in the exaggerated lithotomy position. During this manipulation not more than ordinary care is necessary to avoid disturbing the caudal needle, which is then connected to a 20 cc. Luer-lok syringe by means of a 3 foot length of fine rubber tubing (fig. 2). Although the lapse of time during placing and draping of the patient is ordinarily sufficient for the development of anesthesia, the infallible criterion as to the timing of the incision is relaxation of the sphincter ani. Throughout the operative procedure, procaine hydrochloride solution 1 per cent in 10 cc. amounts is then injected at fifteen minute intervals. This formula also was arbitrarily determined on and may be modified in the individual case as necessary and as determined by the judgment of the anesthetist. In not a few instances the initial 80 cc. injection was found to be adequate for the entire procedure. Figure 3, being a photograph of an anatomic dissection, shows precisely the relationship of the dural sac, nerve roots and caudal needle within the sacral canal.

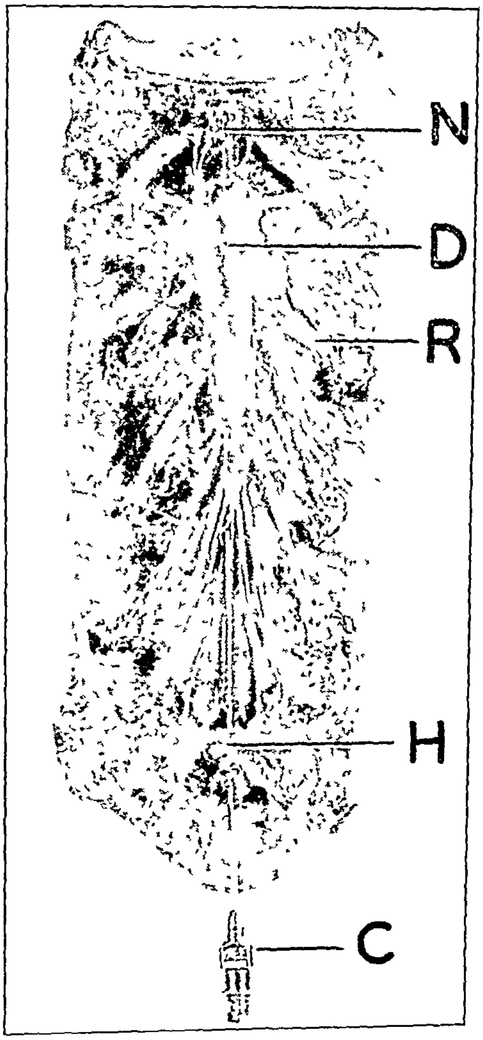

Fig. 3.—Anatomic dissection with entire dorsal surface of sacrum removed, exposing dural sac and nerve roots as they traverse the bony sacral canal: *D*, dural sac, terminating at level of second sacral segment; *N*, nerve fibers within dural sac (cauda equina), *R*, first sacral nerve root; *H*, sacral hiatus; *C*, caudal needle. The small black dots visible around the nerve roots represent cross sections of vessels traversing the sacral foramens. These are not infrequently tapped during the administration of sacral block anesthesia, necessitating replacing of the needles.

RESULTS

This method has given uniformly satisfactory results in 36 consecutive cases without mishap or unfavorable sequelae of any kind. In no instance has supplementary inhalation anesthesia or any supporting measure been necessary. Any complaint, or even any comment at all on the part of the patient during the operation, has been the exception and has been with respect to discomfort incident to the position on the table and wholly unrelated to the operative manipulation. There was no instance of a serious drop in blood pressure. Anesthesia was maintained in this series in a range from fifty to one hundred and fifty minutes with total dosages varying from 80 to 150 cc. of 1 per cent procaine hydrochloride. Drug reactions, characterized by a drop in blood pressure, slow pulse, pallor, perspiration and sometimes a transient loss of consciousness, have never been of serious consequence and may be reduced to minimum frequency by extreme care in avoiding venipuncture. Such reactions may be controlled by the intravenous administration of 50 mg. of ephedrine.

The continuous caudal method has as its obvious advantages its relative simplicity from the point of view of both surgeon and patient as well as the elimination of the need for haste in any unusually prolonged perineal procedure, whether prostatectomy or fistulectomy. In addition to the easily avoided hazard of intravenous injection and the negligible hazard of intradural injection, the only disadvantage which occurs to us is that success is wholly dependent on the accurate placing of one needle only, whereas with the complete sacral block each nerve trunk is bathed in anesthetic solution injected from two or more directions. Our consecutive series of 36 patients without failure, however, would indicate that with reasonable skill the danger of failure properly to introduce the needle is negligible. In spite of the recognized tremendous variation in the bony structure of sacra, so well depicted by multiple illustrations in Lull and Hingson's[4] recent treatise on this subject, the skilled operator almost never fails to introduce the needle into the canal. These results, in seeming contradiction of the opinion formerly "widely prevalent that sacral block anesthesia has a certain inevitable proportion of failure,"[1] averaging about 15 per cent in different hands, may be explained by the larger quantities of solution now employed. We know of no factors determining success or failure, other than proper placing of the needle and the quantity of solution, these being the only variables.

CONCLUSIONS

Uniformly satisfactory results, with complete anesthesia and without toxic manifestations, in a series totaling 36 consecutive cases, justify the conclusion that continuous caudal anesthesia in perineal prostatectomy is feasible and might well supplant other methods. The continuous caudal method is applicable in other perineal operations in addition to prostatectomy.

SELECTION OF HYPERTENSIVE PATIENTS FOR SYMPATHECTOMY

HENRY I. RUSSEK, M.D.
JAMES L. SOUTHWORTH, M.D.
Staten Island, N. Y.
and
BURTON L. ZOHMAN, M.D.
Brooklyn

The demonstration that surgical sympathectomy may favorably influence the course of essential hypertension in man has given emphasis to the role of the autonomic nervous system in the pathogenesis of this disease. Indeed there is much to indicate that (1) neurogenic vasoconstriction is of prime importance in human hypertension and that (2) renal ischemia is a secondary rather than a fundamental phenomenon in its mediation.

Obviously, sympathectomy can be successful only in those instances in which vasospasm is due wholly or in large part to neurogenic influences. As there has been no method by which autonomic activity could be accurately quantified in man, selection of patients for surgery has proved difficult. A test that could determine the presence and degree of participation of a neurogenic element would be valuable. The sodium amytal, sodium nitrite and cold pressor tests, although still widely used, have given ample demonstration of their inability to fulfil this need.[1] High spinal anesthesia[2] appears to yield some information regarding sympathetic participation in hyperpiesia but in our experience introduces factors greatly interfering with proper interpretation of the results. Thus, the loss of muscle tone and complete motor paralysis observed in the lower part of the body in spinal anesthesia may, of themselves, materially affect the height of the blood pressure through the medium of venous stasis, diminished venous return to the heart and fall in cardiac output. In this connection the fundamental role of tonic tissue pressure in determining venous return needs no further emphasis. The alteration in respiration, which becomes entirely diaphragmatic under high spinal anesthesia, further diminishes the return flow to the thorax as a result of a less efficient respiratory "pumping" action. Consequently the hemodynamic response to this procedure does not seem comparable to that following surgical sympathectomy.

In a previous report we[3] described the use of continuous caudal anesthesia as a means of selecting hypertensive patients for surgery. The results in a small series of cases raised the hope that this procedure might eliminate guesswork in making such selection. The following appear to be among the advantages of continuous caudal anesthesia over high spinal anesthesia as a test of sympathetic activity:

1. Muscle tone and motor power in the lower extremities are little affected.
2. Respiration is essentially unchanged.

In view of 1 and 2 a closer approximation to the status after surgical sympathectomy is established.

3. The height of anesthesia is easily and safely raised to the desired level by repeated small injections.
4. The height of anesthesia is readily controlled and may be maintained without danger for hours, permitting performance of other tests at lower blood pressure levels.
5. By gradual and progressive block of sympathetic nerve segments from below upward, correlated with blood pressure readings, a clear concept may be obtained not only with regard to the degree of neurogenic influence but also with respect to the extent of surgery indicated in the given case.
6. Tilting of the patient with feet elevated and head low, in order to minimize venous stasis, may be safely undertaken without danger of depressing medullary centers. In caudal anesthesia the anesthetic agent is extradural and cannot rise above the foramen magnum around which the dura is attached.
7. Nausea, vomiting and toxic symptoms are rare. In 60 cases of essential hypertension in which this test was given we have not encountered a single instance of shock or other serious reaction.
8. The patient appears more comfortable and less apprehensive than when under spinal anesthesia. He can be transported easily and does not require observation after the procedure.
9. The patient may be up and around within a few hours after the test and "spinal headaches" are not subsequently encountered.

TECHNIC OF THE TEST

The patient is placed in a quiet room, and blood pressure readings are taken every fifteen minutes for a period of one hour. Continuous caudal anesthesia[4] employing the technic of high caudal block[5] was used in most instances. After insertion of the needle into the sacral canal a trial dose of 8 cc. of metycaine 1.5 per cent is injected. With no loss of sensation to pin prick or loss of motor power in the lower extremities in ten minutes, it can be safely assumed that the subarachnoid space has not been entered. Thirty cc. of the 1.5 per cent solution is then slowly injected. A progressive loss of painful sensations as caused by pin prick in regions supplied by the coccygeal, hemorrhoidal, perineal, pudendal, ilioinguinal and iliohypogastric nerves ensues. Vasodilatation with flushing of the soles of the feet, cessation of sweating and increase in skin temperature of the feet follows within five to fifteen minutes after injection. The patient is then placed comfortably on his back and 30 cc. of the anesthetic agent is again injected within five to ten minutes after the previous injection. This dosage often suffices to cause a gradual rise in the level of skin anesthesia to the sixth thoracic segment within twenty to thirty minutes (determined by pin prick). In many cases, however, one or two additional injections of 30 to 50 cc. at twenty to thirty minute intervals are required to establish the desired level of anesthesia. Throughout the procedure the latter is determined and recorded every five to ten minutes together with associated blood pressure readings. Subsequent injections of 20 to 30 cc. of metycaine may be employed at variable intervals if it is desired to perform other tests at the lower blood pressure levels. The patient may be tilted at any time with the feet elevated in order to determine the influence of venous stasis on blood pressure.

In a few cases it was found impracticable to raise the level of anesthesia to effective heights by the caudal method. For these we have used continuous peridural anesthesia.[6] Fundamentally this method is the same

as caudal anesthesia, the drug solution causing its effects in the same location and manner. The needle is inserted in the upper lumbar region, however, and by this technic diffusion to the thoracic nerves is more readily obtained.

RESULTS OF TEST

Lowering of the blood pressure to normal levels (140/90 or less) occurred in 32 of 60 hypertensive patients when the level of anesthesia was at the sixth thoracic segment or below. In 8 of these 32 patients normal levels were attained with anesthesia only as high as the tenth thoracic segment. In 18 patients of the entire series there was a moderate fall in blood pressure to levels above 140/90 but considerably below the original resting pressures. Elevation of anesthesia to the fourth thoracic segment brought the blood pressure down to normal levels in 10 of these 18 subjects. Consequently restoration to normal blood pressure was accomplished in 42 of 60 patients by levels of anesthesia varying from the tenth to the fourth thoracic segments. Of the entire series 10 patients showed slight or no response to the test. It is conceivable, therefore, that the reaction of the blood pressure to continuous caudal anesthesia not only may establish the existence of a neurogenic element but may actually suggest the extent of sympathetic denervation necessary to achieve a satisfactory result.

* All pressures were measured with the patient lying down.

To date we have followed the course of 12 patients who were operated on for hypertensive disease. In all cases the procedure advocated by Smithwick[7] was performed. Ten of the 12 patients showed a favorable response to the caudal test and 9 of these responded to surgery in similar manner. The tenth (case 9) has continued to show hypertension in the recumbent position but only mild elevation of the blood pressure on assuming the erect posture. Two patients showing poor response to the caudal test were operated on and in both instances surgery failed to improve their status. From the accompanying table it can be seen that the sodium amytal, sodium nitrite and pentothal sodium tests were unreliable in forecasting the outcome of surgery.

Case 8 is of special interest because only the caudal test suggested possible benefit from sympathectomy. Operation was performed in two stages but the lumbar sympathetic ganglions on one side were not found. The blood pressure remained elevated and persisted around 174/140 in the recumbent position, the original level having been 226/160. The caudal test was repeated and the blood pressure was again found to be considerably influenced by it. The patient was operated on again and this time the lumbar sympathetic ganglions were found and resected. The blood pressure subsequently fell to 150/110 in the recumbent position and has persisted at this level.

Case 9 failed to respond to surgery as favorably as was predicted by caudal anesthesia. The blood pressure in the recumbent position was 220/140 but fell to 156/108 on standing. The caudal test was repeated in this case and it was found that the blood pressure remained relatively unchanged until high levels of anesthesia were reached (eighth thoracic to fourth thoracic). This was in distinct contrast with the findings in the preoperative test. It seemed, therefore, that while denervation appeared complete at the lower levels a more extensive sympathectomy might have improved the results. The difference between the preoperative caudal test and the result following sympathectomy may be explained by the fact that in the latter the thoracic ganglions only as high as the ninth segment were resected, while in the caudal test functional denervation as high as the sixth thoracic segment was achieved and used as a basis for prognostication. In an appreciable number of cases under caudal anesthesia we have noted a definite decrease in blood pressure with only slight increase in the extent of denervation.

The large variation in the response of hypertensive patients to continuous caudal anesthesia may conceivably form the basis for decision as to the extent of surgery indicated in a given case. Thus the patient whose blood pressure is reduced to normal with anesthesia only as high as the tenth thoracic segment may merely require supradiaphragmatic resection of the splanchnic nerves (Peet[8]) or infradiaphragmatic resection (Craig and Adson[9]) or one of the other less extensive procedures to achieve a satisfactory result. Patients requiring levels of anesthesia as high as

---

[7] Smithwick, R. H.: A Technic for Splanchnic Resection for Hypertension: Preliminary Report, Surgery 7: 1-8, 1940.

[8] Peet, M. M.: Splanchnic Section for Hypertension: Preliminary Report, Univ. Hosp. Bull., Ann Arbor 1: 17-18, 1935.

[9] Craig, W. M., and Adson, A. W.: Hypertension and Subdiaphragmatic Sympathetic Denervation, S. Clin North America 19: 969-980, 1939

the sixth thoracic segment for favorable response of the blood pressure may be the candidates requiring the Smithwick type of resection.[7] Finally we have observed a group of patients who, under caudal anesthesia, show progressive but slow decline in blood pressure so that satisfactory readings are not obtained until the level of skin anesthesia reaches the fourth or even the second thoracic segment. It is possible that these patients can be aided only by total sympathectomy (Grimson[10]). The differences in response to caudal anesthesia may well explain the lack of uniformity in the reported results of various surgical technics.

The use of continuous caudal anesthesia demonstrates that a safe and reliable means exists of producing functional block of the sympathetic nervous system. The method offers a challenge to research for the discovery of a sympatholytic drug capable of prolonged effect, which may render surgery unnecessary.

SUMMARY AND CONCLUSIONS

Continuous caudal anesthesia reduced the blood pressure to normal in 42 of 60 hypertensive patients given this test. Eight patients showed a moderate fall of blood pressure but remained hypertensive even at relatively high levels of anesthesia. Ten patients showed slight or no response to the test.

Observations of the response of the blood pressure to continuous caudal anesthesia were used to predict the outcome of surgical sympathectomy in 12 hypertensive patients. The results were accurately forecast in 11 of the 12 instances. Other tests were found unreliable when employed for this purpose.

Continuous caudal anesthesia may be of value in the selection of hypertensive patients for sympathectomy and in dictating the extent of surgery necessary for a successful result in individual cases

THE CLINICAL USE OF ORAL BASAL TEMPERATURES

M. EDWARD DAVIS, M.D.
Chicago

Tompkins[1] in 1944 called attention to the value of basal temperatures for the determination of the time of ovulation. He reviewed the literature briefly and emphasized the fact that little clinical use has been made of this important physiologic phenomenon in the interpretation of the events in the normal ovarian cycle. His most important contribution was the designing of a practical temperature graph for the use of the patient and providing explicit directions so that the graph could be filled out readily and accurately. The introduction of this graph has increased the interest of the profession in this practical method of studying ovarian changes.

During the past two years we[2] have collected basal temperature graphs in over 500 patients. This study has been correlated with a study of vaginal smears, endometrial biopsies and operative material whenever it was available. Many interesting observations have been made and, like Tompkins, I have been impressed with the simplicity of a diagnostic method which can yield a tremendous amount of information. This short report has a twofold purpose: (1) to point out again the value of basal temperatures in the clinical interpretation of ovarian physiology and (2) to urge the substitution of oral temperatures in place of the objectionable rectal and vaginal temperatures in use at the present time.

Body temperature variations in healthy persons, young and old, have been known for many years. It is a sensitive barometer of physical as well as mental activity, metabolic activity and other physiologic functions. Muscular work, food taking, mental excitement and extraneous stimuli all tend to raise the level of temperature of the healthy person. Typical curves have been set up demonstrating the fluctuations in body temperature during the twenty-four hour period under varying environmental conditions. They follow a diurnal pattern because days are devoted to activity and nights to rest. Kleitman and his co-workers[3] spent a week in a subterranean cave devoid of outdoor light and proved that day and night could be eliminated as factors influencing body temperature, for the curve could be altered by changing the period of rest and activity.

In the healthy male there is no variation in the daily pattern other than that induced by the foregoing factors. In the female ovarian activity alters this daily basic curve. Follicle rupture and corpus luteum development raise the level of the basal temperatures during the latter half of the cycle. The relationship of ovarian activity and body temperature has been demonstrated by a number of authors. Rubenstein[4] in 1939 initiated an extensive study to correlate these physiologic phenomena.

Kleitman[5] has pointed out that in his extensive studies of body temperature the pattern of the curve obtained by oral recordings was similar to that obtained by rectal recordings. Oral temperatures are about 1 degree Fahrenheit lower than rectal temperatures. In his experience the morning basal temperature obtained orally is more accurate than recordings at any other time of the day, for no liquids or food have been consumed for many hours. Furthermore, a curve constructed from a single daily recording provides reliable information for clinical interpretation. Additional temperature readings may be of some help in noting the temperature drop preceding the ovulatory rise.

I have replaced my own graph with the Tompkins chart since its introduction. Oral temperatures are recorded rather than rectal temperatures or vaginal temperatures as suggested by some investigators. Although oral temperatures are somewhat lower than rectal temperatures, the basic pattern of the curve remains the same. I have found that women do not like the idea of taking rectal temperatures because it is inconvenient and unesthetic. It is simple to place the thermometer in one's mouth immediately on awakening. This simple procedure involves little or no activity.

The thermometers on the market are designed in such a way that they are difficult to read. Recently a thermometer has been introduced by the Taylor Instrument Company in which the mercury column is visible readily. We have spent some time with each patient instructing her in reading the thermometer and in explaining to her the purpose of the basal temperatures and their proper recording. She is urged to place the thermometer in her mouth immediately on awakening before she resorts to any activity. It is helpful to have the patient bring the graph at the end of a month so that it can be inspected to make certain that it is being kept properly.

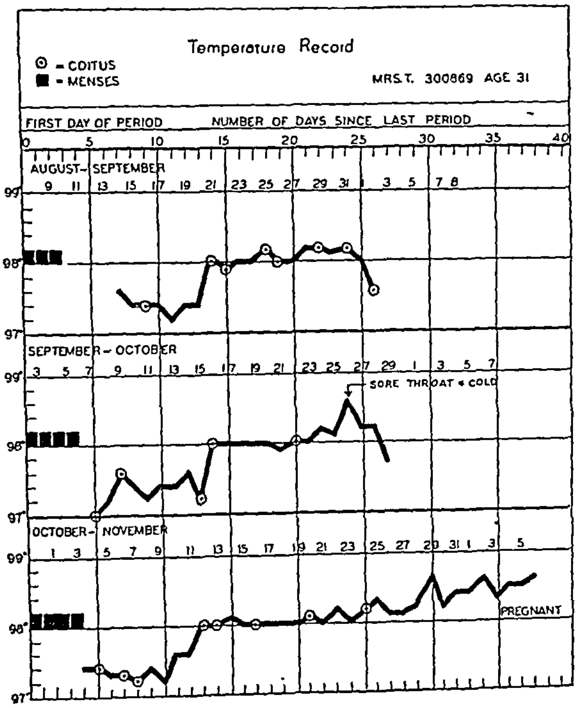

Chart 1.—This patient menstruates every twenty-six to twenty-nine days for three or four days. The drop in temperature from the preovulatory basal level occurred on days eleven, fifteen and ten. When coitus occurred at the time of the drop in September, no pregnancy resulted. However, when it took place at the peak of the rise, conception followed. Note the drop in temperature thirty-six hours prior to the onset of bleeding.

The more careful the record is maintained, the more valuable are the data to the physician.

The patient is asked to indicate on the graph the menstrual days, any unusual occurrence, illness, coitus and special medication (endocrine patients). Basal temperatures are significant if the daily routine of the patient does not vary considerably. A patient who arises at widely varying hours is likely to have an irregular basal curve which may provide little information. A single reading on arising in the morning provides all the information needed.

Basal temperatures are reliable indexes of ovarian activity in at least three out of four women. In the remaining one the curve is so atypical with irregular readings at intervals that no accurate interpretation of physiologic changes can be made. In the group of women with typical curves an accurate correlation between basal temperatures and physiologic changes can be made.

THE TYPICAL BASAL CURVES

The temperature drops twenty-four to thirty-six hours before the onset of bleeding, reaching a low level during the first day or two after the onset of the menses. This low level continues during the entire menstrual phase and to the midinterval, when ovulation occurs usually in the woman who has a twenty-seven to thirty-one day cycle. Typically there is a further sharp drop in the temperature from the base line just prior to the ovulatory rise, although this drop may not be apparent. The temperature rises abruptly during the next twenty-four to thirty-six hours, reaching a plateau, where it remains until twenty-four to forty-eight hours before the onset of bleeding in the following period. The rise is a clearcut phenomenon and the temperature curve after the rise is in sharp contrast to that preceding it (chart 1).

It has been assumed that the drop prior to the rise signifies ovulation and that this point would represent the most fertile period in the cycle. The majority of the pregnancies followed coitus during the period of temperature rise following this drop and immediately after it has reached its upper plateau. Clinically, it is difficult to interpret the preovulatory drop in temperature but it is relatively easy to note the ovulatory rise. It is my impression that the rise is brought about by ovulation and that the elevated basal temperatures are maintained by the corpus luteum activity. Persistence of the elevated temperature during pregnancy would add weight to this interpretation. I am attempting to reproduce normal basal temperature curves in young castrates by endocrine substitution. These experiments may add some information.

When pregnancy occurs, the basal temperature remains at the postovulatory level during the first few months of the gestation (charts 1 and 2). At this time a drop occurs in most patients, but it does not return to the preovulatory level until the end of gestation. In the postpartum period there is little variation in temperature until ovulation has been resumed. Basal temperature curves indicate that the first bleeding period is rarely ovulatory in character and that the second menstrual period is associated with ovulation in approximately half of the patients (chart 3). This confirms the observations which my associates and I made previously in a group of women in whom endometrial biopsies were obtained at every bleeding period for as long as a year. These studies revealed this typical pattern for the resumption of ovulation following parturition.

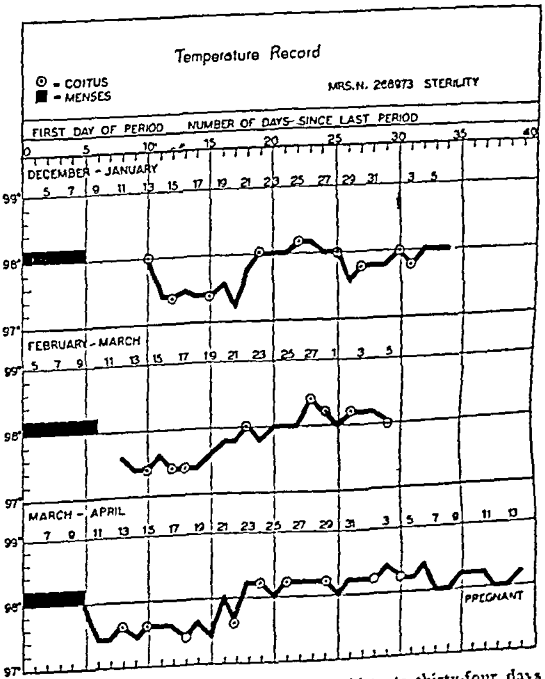

Chart 2.—This patient menstruates every thirty to thirty-four days for five or six days. Conception could have occurred when the temperature was rising or within twenty-four hours after it had reached a peak. In this graph, as well as in chart 1, note the persistence of the postovulatory level after conception.

STERILITY STUDIES

A basal temperature curve should be a part of every sterility study. It is the simplest device for ascertaining ovarian activity and dating ovulation. Other methods to determine whether a cycle is ovulatory are more difficult and do not provide as much information. Endometrial biopsies are usually taken at the onset of the menses and provide information concerning the preceding cycle. They are time consuming and cannot be repeated indefinitely. Pregnandiol determinations provide indirect information concerning ovarian activity, but they are laborious procedures. Basal temperatures indicate ovulatory cycles and the time of ovulation within a twenty-four to forty-eight hour period.

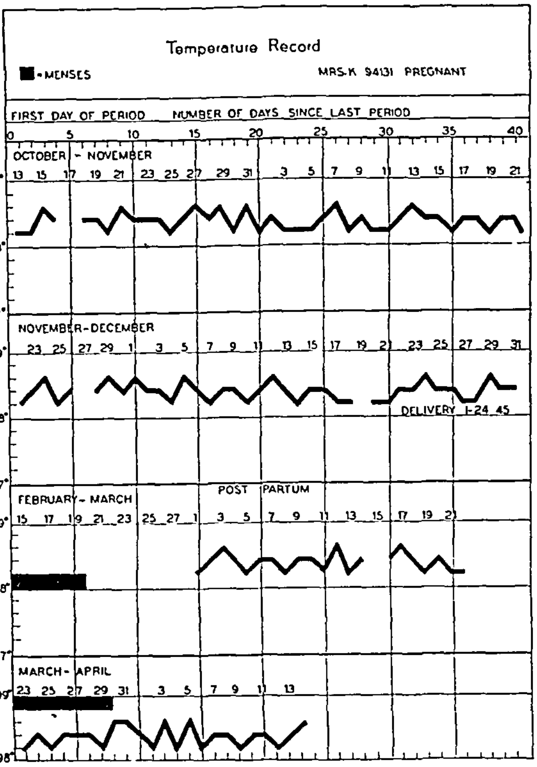

Chart 3—A temperature record during the last three months of a normal gestation and during the first two menstrual periods following delivery. The patient delivered on Jan 24, 1945 Her first bleeding period occurred from February 15 to 20 and it was anovulatory in character, as revealed by the temperature curve and an endometrial biopsy at the time of bleeding The second menses lasted eight days from March 23 to 30 It was likewise anovulatory. The third period occurred thirty days later and was preceded by a typical ovulatory temperature curve Biopsy of the endometrium at the onset of bleeding revealed a progestational phase

Patients can be instructed to have coitus as the temperature drops preceding the ovulatory rise, as it rises, and when it has first reached its postovulatory peak. This has been possible in at least 75 per cent of our patients. Assuming that the life of the ovum is very short, certainly less than twenty-four hours, and the spermatozoa retain their fertilizing power for about twenty-four to thirty-six hours, it is possible to provide spermatozoa at the proper time in most instances. This must necessarily increase the likelihood of conception and this fact has been borne out in our experience. In some instances we have learned from the record that coitus has taken place at too frequent intervals, thereby decreasing the fertility of the male (chart 4). On several occasions conception followed promptly the restriction of intercourse to that period when ovulation was indicated by the rise in basal temperature. Excessive sexual activity is of particular importance in couples of low fertility as a result of a low sperm count in the male or some other factor. Thus, our basal temperature records have provided us with much pertinent information concerning the sexual life of our sterile couples.

DIAGNOSIS OF EARLY PREGNANCY

The persistence of the postovulatory elevated temperature in the event of conception constitutes the most accurate early data concerning a pregnancy. During the first week of the missed menstrual period the failure of the temperature to drop provides reliable information concerning a possible pregnancy. This information may be of value in patients who have had abortions early in pregnancy so that therapy may be instituted when it is most likely to be effective and a regimen to safeguard the pregnancy instituted. The patient in whom the periods vary in length considerably will provide less information by the temperature curves.

AS AN AID IN PREVENTING PREGNANCY

A basal temperature record can be used to determine the fertile period in women who do not wish to use contraceptive aids. It is a more accurate method of determining ovulation than arbitrarily dating it fourteen days from the next expected menstrual period. The woman is asked to refrain from coitus from the preovulatory drop in temperature until thirty-six to forty-eight hours after the ovulatory rise has reached a plateau. In the woman with a typical curve the fertile period can be narrowed down to three days or less. The woman who has an atypical curve can refrain from coitus from day nine or ten until forty-eight hours after the rise has reached the postovulatory plateau. This will increase the length of the period of sexual abstinence but it will decrease the hazard of a possible

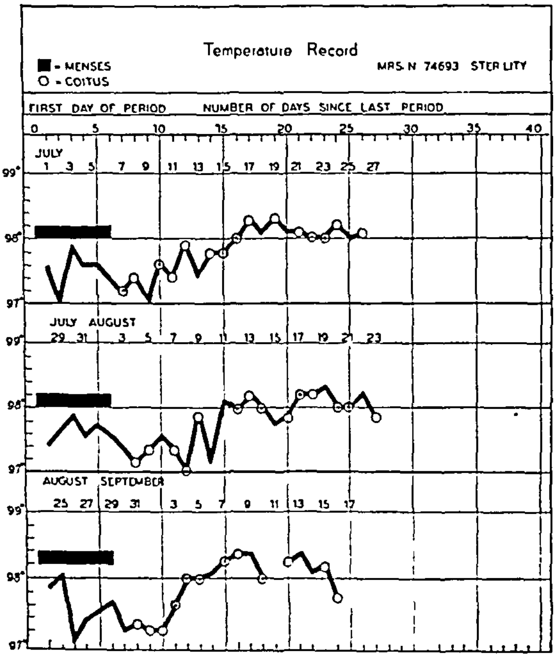

Chart 4—A sterility patient who had typical temperature curves indicating regular ovulatory cycles every twenty five to twenty seven days The husband had a low spermatozoa count but was otherwise normal The frequency of coitus was noted in the record and was due to the great desire of the couple for a baby When coitus was restricted to the period of ovulatory rise in temperature the patient conceived the following month.

pregnancy. A group of women have followed these simple instructions during the past year and have had no difficulty thus far.

IN THE MENOPAUSAL PERIOD

Many women are concerned about the possibility of a pregnancy in the menopausal period. Menstruation becomes irregular and the normal pattern disappears. More and more of these menstrual cycles are anovulatory in character. Eventually sporadic ovulations likewise disappear.

A group of women have followed their basal temperatures during the period of the climacteric. It soon became apparent to them that fewer and fewer periods were associated with ovulation. Obviously there is no danger of conception in the absence of ovulation. When bleeding ceases entirely the curve assumes the typical diurnal pattern seen in the male, for ovarian activity is at a low ebb.

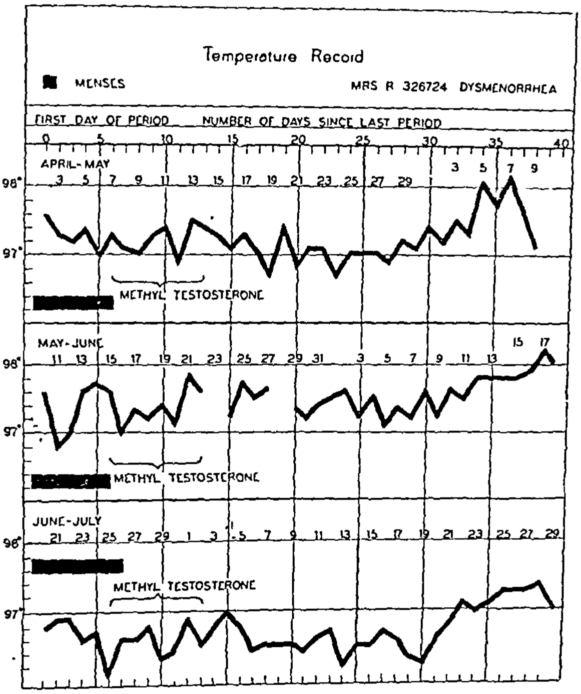

Chart 5.—The effect of methyl testosterone administered orally can be seen in this temperature record. The normal menstrual pattern of twenty-seven to thirty-one days has been disturbed. Ovulation has been suppressed and the cycles have been lengthened. The effects of various endocrine preparations can be studied more intelligently by the use of basal temperatures.

IN THE PATIENT WITH AN ENDOCRINE PROBLEM

All gynecologic endocrine studies should include a record of basal temperatures. The frequency of the menstrual periods, their length and character can be noted in the graph. Ovulatory cycles can be differentiated from anovulatory ones. Such information should not replace other data obtained by a careful endocrine study, but it will help in the diagnosis and management of the patient.

The effect of medication on ovarian activity and menstruation can be followed. The following examples from our studies can be cited: Patients with complete ovarian failure have a typical diurnal temperature pattern seen in the male. The various gonadotropins have not influenced the character of the curve. Chart 5 is the record of a patient with severe dysmenorrhea treated by methyl testosterone administered orally. It will be noted that the preparation altered the regular twenty-seven to thirty-one day ovulatory cycles and induced irregular cycles lasting much longer. Ovulation is suppressed and the postovulatory rise did not occur. The relief of the dysmenorrhea in this instance was the result of an inhibition of ovulation, as is often the case. The cessation of medication resulted in a prompt return of normal ovarian function and a typical ovulatory temperature curve.

CONCLUSIONS

An accurate graphic record of morning basal temperatures taken orally will provide pertinent data concerning ovarian activity and ovulation. Such a record should become part of all gynecologic endocrine studies, sterility investigations and in any other case in which information concerning ovarian activity is important. Temperature curves can be used as contraceptive aids. More widespread clinical use of the physiologic phenomenon of body temperature changes should be made by physicians.

Clinical Notes, Suggestions and New Instruments

MYCOTIC MENINGITIS DUE TO CANDIDA

BÉLA HALPERT, M.D.
and
HARRY WILKINS, M.D.
Oklahoma City

The clinical history and necropsy findings are presented of a patient who died with central nervous system involvement of an obscure nature. At necropsy the appearance of the lesion suggested tuberculous meningitis. However, microscopic examination revealed the presence of, and the reaction to, a fungus of the genus Candida, probably Candida albicans. The case is presented because Candida is a rare cause of meningitis. Smith and Sano[1] and Miale[2] have reported instances of meningeal involvement by Candida albicans. This however is the first case in which localization occurred in the central nervous system only.

REPORT OF CASE

L. J., a Negro aged 25, was first seen at the University Hospitals on Sept. 1, 1941, when he complained of headache of eleven months' duration. The pain was bitemporal with the sensation of the eyes "drawing." Four months prior to admission his neck became painful and diplopia developed. Two weeks before admission these symptoms became more severe, his vision tended to decrease and tinnitus occurred. On admission he was stuporous but could easily be aroused. Gross paresis was absent, nuchal rigidity was present and Kernig's sign was positive bilaterally. The pupils were unequal, with the left larger than the right. There was paralysis of the left abducens nerve. Lateral nystagmus was noted when the eyes turned to the left. Papilledema was evident bilaterally. Visual fields were of normal outline. Cutaneous and deep sensations were undisturbed and the motor pathways were intact. The tendon reflexes were decreased to absent, and Babinski's sign was negative. There was slight incoordination in the finger to nose test on the left. The pulse rate was 76 and the blood pressure 108/68. Other physical findings were essentially negative. Roentgenographic examination of the skull suggested an erosion of the tip of the left petrous bone but no other changes. The Kahn test of the blood was negative. The presence of an intracranial neoplasm was suspected, so spinal puncture was considered to be contraindicated and ventriculograms were made on October 8. These disclosed a moderate internal hydrocephalus with air passing freely into the dilated fourth ventricle. The presence of an intracranial neo-

[2] Miale, J. B.: Candida Albicans Infection Confused with Tuberculosis, Arch. Path. **35**: *427-437* (March) 1943.

plasm was excluded. The ventricular fluid contained 66 cells per cubic millimeter, all lymphocytes. The total protein content was 50 mg. per hundred cubic centimeters. The Kolmer-Wassermann test was negative. The colloidal gold curve was 2222110000. Three weeks later, October 30, the cerebrospinal fluid contained 1,215 white blood cells with 60 per cent neutrophils and 40 per cent lymphocytes. The protein content was 200 mg. with 2 plus globulin, chlorides 650 mg. and sugar 39 mg. per hundred cubic centimeters. The Kolmer-Wassermann test was negative and the colloidal gold curve was 4554443221. No acid fast organisms were demonstrated.

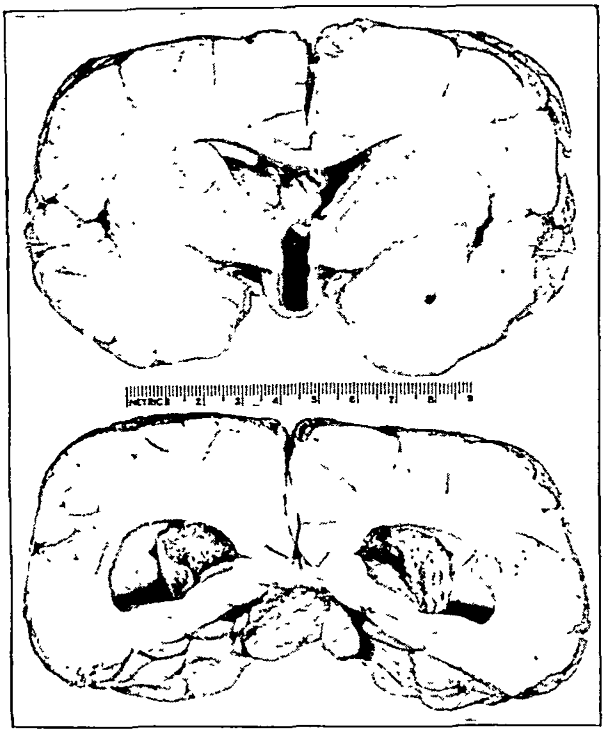

Fig. 1.—Frontal sections of the cerebral hemispheres, disclosing dilatation of the cavities of the lateral and third ventricles.

These data suggested that a low grade chronic infectious process was present: the decreased chloride content and reduced sugar level pointed toward tuberculous meningitis. Considering the absence of other symptoms of tuberculosis, the process was thought to be syphilitic on the basis of the paretic curve. Accordingly bismuth and potassium iodide therapy was instituted. The patient's temperature, which for a while varied between 98 and 102 F., became normal and he improved subjectively and objectively and was discharged with instruction to continue antisyphilitic therapy in his local dispensary.

This treatment was discontinued after thirteen injections when at another clinic he was told that he did not have syphilis. He continued to be unable to work but presented no additional symptoms until May 1942, when, overnight, he completely lost the use of his lower extremities and developed urinary and fecal incontinence. He had several convulsions. He was readmitted to the University Hospitals on June 15, 1942. At this time he appeared poorly nourished, responded to questions slowly and spoke incoherently. His temperature was 97.6 F., the blood pressure 70/50 and the pulse 92 per minute, and regular. His skin was cold and clammy. The pupils were unequal and reacted to light. The biceps and triceps reflexes were hyperactive. The abdominal, cremasteric and patellar reflexes were absent. Babinski's and Hoffman's signs were negative. There was an absence of discriminatory sensations of touch below the seventh cervical vertebra. Blood and urine examinations were essentially negative. The Kahn test of the blood was negative. The nonprotein nitrogen was 35.9 mg. and the blood sugar 165 mg. per hundred cubic centimeters. Examination of the cerebrospinal dynamics gave evidence of an almost complete block of the canal. The cerebrospinal fluid contained 23 white blood cells; total protein was 125 mg., chlorides 520 mg. and sugar 90 mg. per hundred cubic centimeters. The Kolmer-Wassermann test was negative. The colloidal gold curve was 5555543210. A twenty-four hour culture was negative. The blood sugar was 165 mg. with no glucose in the urine on repeated examinations. The patient continued to have a slight inequality of the pupils and a disturbance in lateral gaze on the left. There was bilateral papilledema. Ventriculograms disclosed some increase of the dilatation of the ventricles, including the fourth. A suboccipital craniotomy with cervical laminectomy was contemplated. Before this could be carried out, however, the patient's condition became critical; there was a disturbance of swallowing and a terminal rise in temperature to 107 F. The patient died on July 9, 1942.

At necropsy (ten hours after death) the body was 180 cm. tall and weighed approximately 65 Kg. There was wasting of the flesh, particularly of the extremities. Pressure sores were noted over the sacrum and the trochanteric areas about 10 by 8 cm. each. The superficial lymph nodes were not palpably enlarged. The peritoneal cavity contained no excess fluid; its surfaces were smooth and glistening. There were no anomalies in the position of the abdominal organs. There were some fibrous adhesions posteriorly in the left pleural cavity and some over the base posteriorly in the right pleural cavity. No changes were noted in the pericardial cavity. The heart measured 10.5 cm. from base to apex and 11 cm. across the base. The chambers and their orifices were proportionate and their valves were delicate. The heart weighed 325 Gm.

There was some reddening of the bronchial mucosa, and the lumens of the bronchi contained thick mucus. The interlobar surfaces of the right lung were almost completely obliterated by fibrous adhesions. The anterior portions were pink and crepitant; the posterior portions were lumpy and consolidated. The cut surfaces were mottled red and gray, with the lumens of the bronchial branches prominent and their mucosa reddened. This lung weighed 725 Gm. The left lung resembled the right and weighed 670 Gm.

No pertinent changes were noted in the spleen, liver, gallbladder and biliary ducts, pancreas, esophagus, stomach, duodenum, jejunum, ileum, colon and rectum, adrenal glands and kidneys. The wall of the urinary bladder was of the usual thickness. The mucosa was reddened and there were yellow gray crusts overlying prominent mucosal folds. Smears from these areas disclosed gram positive cocci in clusters. The prostate, seminal vesicles and testes were of usual size and appearance.

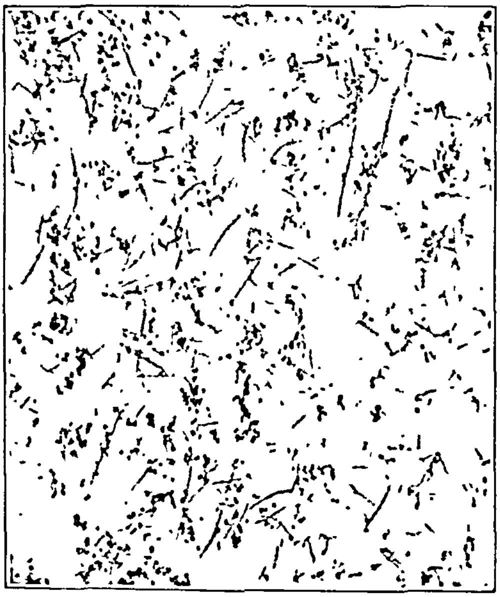

Fig. 2.—Mycelia within the subarachnoid space. × 125.

Brain tissue protruded through the trephine holes in the parietal regions of the calvarium. The dura mater was tense.

The leptomeninx over the convex surfaces of the cerebral hemispheres was pale, delicate and transparent. The convolutions were flat and the sulci were narrow. The leptomeninx was thickened and cloudy over the base of the brain, obscuring the vessels of the circle of Willis and the roots of the cranial nerves. There was bulging and thinning of the infundibulum. A thick creamy liquid filled the cisternal spaces including the cisterna magna. The cerebral and cerebellar hemispheres, the cerebral peduncles, the pons and the medulla oblongata were proportionate and symmetrical. The brain weighed 1,300 Gm. The sella turcica appeared broad and measured 2.6 by 2.2 by 1.2 cm. The hypophysis was flat and occupied the base of the sella. It measured 1.6 by 1.2 by 0.6 cm. No changes were noted in the dural sinuses and the dura proper. Further examination after fixation disclosed intact symmetrical patterns on the cut surfaces of the cerebral peduncles. The aqueduct of Sylvius was slitlike and measured 0.5 by 0.3 cm. The cut surfaces of the vermis cerebelli had the usual delicate pattern. The cavity of the fourth ventricle was distended. The floor appeared intact. No change was noted on the cut surfaces of the pons, medulla oblongata and cerebellar hemispheres. On frontal sections of the cerebral hemispheres the cavities of the lateral and third ventricles were five to ten times their usual width (fig. 1). There was asymmetry of the foramens of Monro, the right being twice the size of the left. Otherwise there was perfect symmetry of the two sides with the usual patterns of the gray and white matter well preserved. No areas of softening or hemorrhage were noted. On microscopic examination pertinent changes of the heart, lungs, spleen, liver, pancreas, adrenal glands, kidneys, urinary bladder, testes and aorta were limited to acute focal pneumonia, chronic and acute cystitis and, in the testes, atrophy with hyaline change of many of the seminiferous tubules. There was no syphilitic aortitis

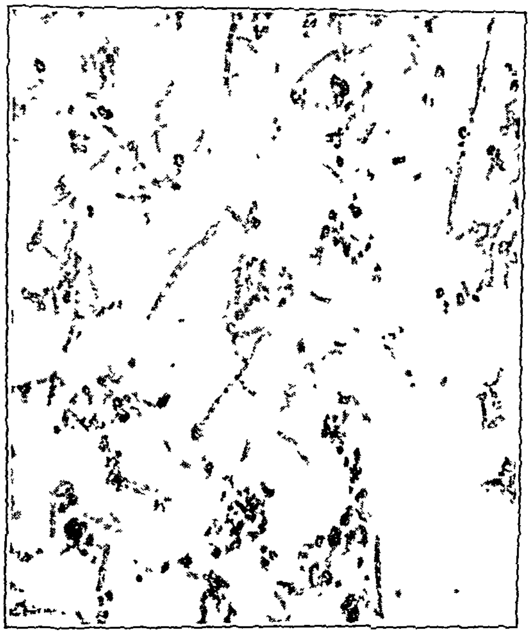

Fig. 3.—Mycelia within the subarachnoid space, × 300.

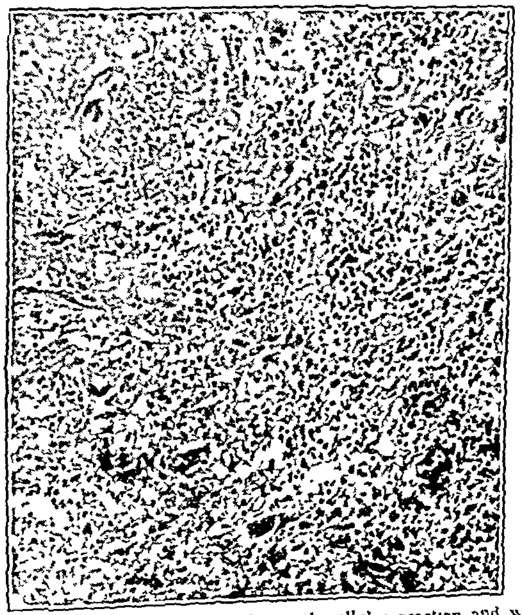

Fig. 4.—Mycelia in the leptomeninx with cellular reaction and within giant cells, × 125.

Preparations from the brain were stained with hematoxylin and eosin and also by Gram's method. Within the leptomeninx covering the pons and particularly the cerebellum there was an increase of the connective tissue with structures resembling tubercles. These had central areas of necrosis and giant cells. Within these nodules and elsewhere there were septate mycelia branching at acute angles. Many of these mycelia lay free or surrounded by polymorphonuclear granulocytes (figs. 2 and 3). Other mycelia were intracellular within huge giant cells (figs. 4 and 5). Some of these giant cells were of the foreign body type, others of the Langhans type. There were also infiltrations with lymphocytes, plasma cells and large mononuclear cells. There was no involvement of the underlying brain tissue. Ziehl-Neelsen stain for acid fast organisms was negative.

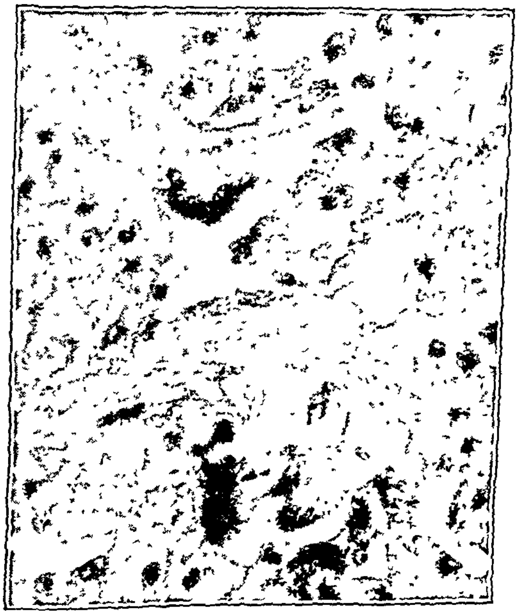

Fig. 5.—Mycelia in the leptomeninx with cellular reaction and within giant cells, × 560.

COMMENT

The clinical course and laboratory data provided no conclusive information as to the nature of the central nervous system involvement, except that the presence of a neoplasm could be excluded. The evidence was in favor of a chronic inflammatory process. If mycotic involvement had been suspected, culture of the cerebrospinal fluid in appropriate mediums might have resulted in a demonstration of the causative organism. At necropsy the lesion so closely imitated a tuberculous lesion that no cultures were made. Examination of the fixed and stained tissues, however, revealed the presence of a fungus and the reaction to it. Close scrutiny of this organism left no doubt as to its identity as a fungus of the genus Candida, probably Candida albicans.

SUMMARY

A Negro aged 25 died of meningitis produced by a fungus of the genus Candida, probably *Candida albicans*. This is the third reported instance of meningeal involvement by the organism Candida and the first in which localization occurred in the central nervous system only.

SEVERE BURNS FROM INFLAMMABLE COWBOY PANTS

W. EMORY BURNETT, M.D.
and
H. TAYLOR CASWELL, M.D.
Philadelphia

During the period from August 1944 to March 1945 3 patients with third degree burns involving most of both lower extremities were admitted to Temple University Hospital. These occurred in boys aged 10, 8 and 6½ years respectively and were remarkably similar in distribution, severity and history. All of these children had been wearing cowboy pants covered with a shaggy material and bearing the trade name "Gene Autry." In all 3 cases apparently trivial exposure to fire caused immediate and complete ignition of the pants.

The first patient was playing at a bonfire and an ignited stick, which had been thrown into the air, struck the side of his pants in descent. This was followed by what was described as a sudden bursting into flame of all the shaggy material on the clothing. The second patient ran by a small collection of what was described as smoldering leaves, with immediate and complete ignition of the pants. The third patient leaped over a small pile of burning rubbish with the same immediate result.

In the April 12, 1945 issue of the Philadelphia *Inquirer* an article was carried describing the death of 3 children in Washington, D. C., and of another child in the Philadelphia area from similar accidents. Two additional nonfatal burns were also reported in the Philadelphia area. The newspaper stated that all of these children were wearing the so-called "Gene Autry" cowboy suits, which were manufactured by "a New York concern with another plant in Passaic, N. J." The newspaper also stated that the suits were to be subjected to a Congressional investigation and that "leading Philadelphia area stores have withdrawn this particular type of playsuit from their stocks."

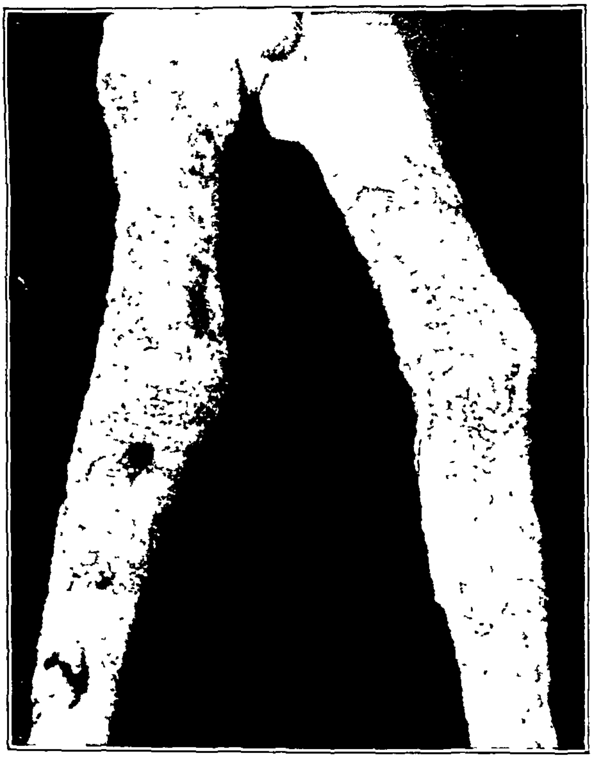

Fig. 1.—Full thickness burns of patient 1 three months after admission, ready for grafting.

The patients admitted to Temple University Hospital were not mentioned in the newspaper article but had remarkably similar experiences in that the burns were of the third degree and involved the entire circumference of the thighs and lower part of the legs, approximately 30 per cent of the body surface. The feet were not involved in any instance, and only the first patient suffered burns of the buttocks.

Patients 1 and 2 were originally admitted to this institution and treated in an exactly similar fashion. Patient 3 was transferred after six months' treatment in another institution, during which time feces had infiltrated under a soft eschar of hemoglobin and penicillin with prolonged contamination and sepsis.

PRINCIPLES OF TREATMENT

The following principles of treatment were used in the three clinical stages of third degree burns:

1. *Stage of Shock.*—On admission the patients were wrapped in sterile sheets and taken to the operating room after appropriate morphine dosage. In the operating room, under aseptic technic, the remaining clothing was cut away and the burned areas were gently cleansed with sterile cotton balls saturated in warm sterile water and white soap. Loose skin was gently debrided and the entire extremity wrapped in petrolatum gauze, dry gauze, mechanic's waste and Ace elastic bandage as recommended by Koch.[1] On return to the ward, plasma infusion was begun. The amount of plasma given was estimated on the percentage of body surface involved, 50 cc. being given for each 1 per cent of body surface burned. By the means of daily hematocrits, proteins and blood counts combined with daily blood chlorides and carbon dioxide combining power estimations the chemical and protein requirements were closely followed. In no twenty-four hour period did the amount of glucose, saline solution and so on exceed the amount of plasma. All the patients were given 100,000 units of penicillin intramuscularly each twenty-four hours in twelve equal doses. Sulfonamides by mouth were given to patients 1 and 2 for the first two weeks following the burn. Massive vitamin therapy was started immediately, which consisted of niacinamide 100 mg., thiamine hydrochloride 50 mg., riboflavin 10 mg. and ascorbic acid 200 mg. daily intravenously and vitamin A 100,000 units daily intramuscularly. At the same time measures were instituted to maintain a concentrated diet containing as high as possible a percentage of protein and carbohydrates. This was accomplished by the use of standard high carbohydrate, high protein hospital formulas and the encouragement of the parents to bring in food of which these children were particularly fond.

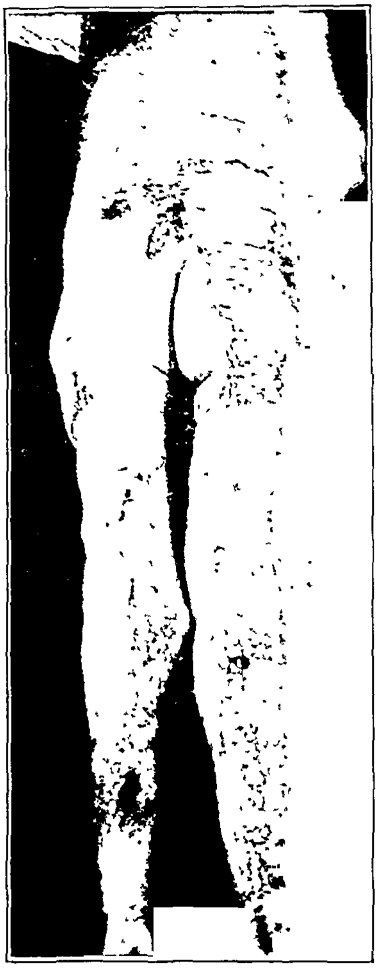

Fig. 2.—Posterior view of burns of patient 1 three months after admission. Note third degree burns over buttock. Sacral ulcerations are healing decubitus ulcers.

2. *Stage of Infection.*—All of these cases were third degree burns and, despite the Koch compression treatment and redress-

---

[1] Allen, H. S., and Koch, S. L.: The Treatment of Patients with Severe Burns, Surg., Gynec. & Obst. 74:914-923, 1942.

ings under operating room technic, all became infected. This has been our experience in various cases of third degree burns and also the experience of others. The original dressings were not disturbed until fever, odor and appearance made the diagnosis of infection apparent. All dressings were done in the operating room under aseptic precautions and with the use of general anesthesia. Cultures of the burns were taken whenever it seemed indicated. The initial dressings were accompanied by débridement of obvious slough by sharp dissection. From this time on the dressings were kept saturated with tyrothricin solution and the systemic penicillin was continued. Blood was used frequently during this stage of infection, and at least 500 cc. of blood per week was administered to combat anemia, and amino acids and other substances to maintain blood proteins at a satisfactory level.

During this stage patient 1 exhibited clinical evidence of gastric ulceration, which was treated by an ulcer diet and aluminum hydroxide, with rapid abatement of symptoms. It was a most difficult problem to maintain a high protein intake in these patients in spite of 500 cc. of amino acids intravenously daily. (The lack of appetite was a great tribulation to us.) It is interesting to note that positive nitrogen balance, as evidenced by weight gain, was not attained until grafting was begun.

3. *Stage of Grafting.*—When slough had separated under the tyrothricin dressings and the ulcerated areas appeared to be satisfactorily granulating, grafting was begun. Positive cultures can always be obtained from such granulating areas and were not alone considered as contraindications to grafting. The temperature curve and the patient's nutritional status, as evidenced by his blood proteins, were more reliable indicators. Tyrothricin locally was continued throughout this stage of grafting. Systemic penicillin was also given if any febrile episodes developed during this era. All skin grafts were 0.012 inch in thickness and were removed by means of the Padgett dermatome. It was possible by this means to take several grafts from the same area over a course of months. The Sano[2] plasma clot technic for fixing grafts was used throughout. This consists in using liquefied plasma on the under surface of the grafts and cell extract on the recipient areas. The graft is then put in place and firm, even pressure applied for five minutes. In practically all of the grafting done in these cases this resulted in what would be considered a quite satisfactory take. The dressings were not changed between grafting procedures. Weekly transfusions, daily amino acids and massive vitamin therapy were continued, and the efforts to maintain a high protein, high carbohydrate intake were pursued.

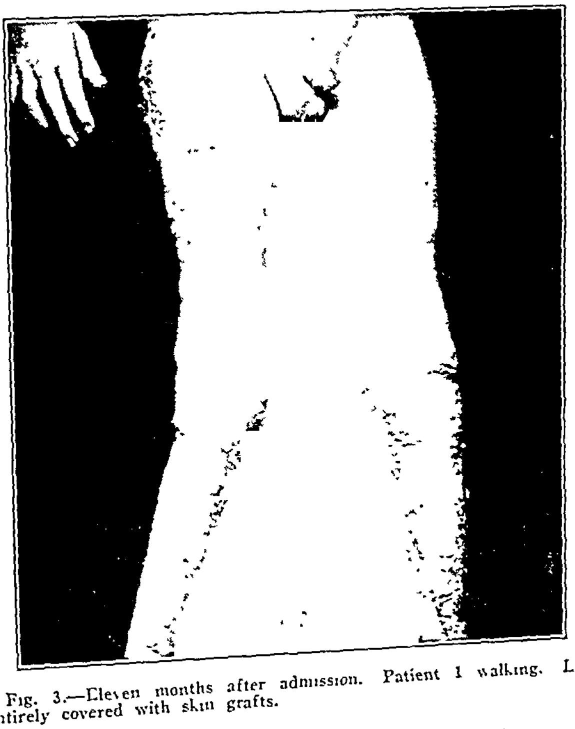

Fig. 3.—Eleven months after admission. Patient 1 walking. Legs entirely covered with skin grafts.

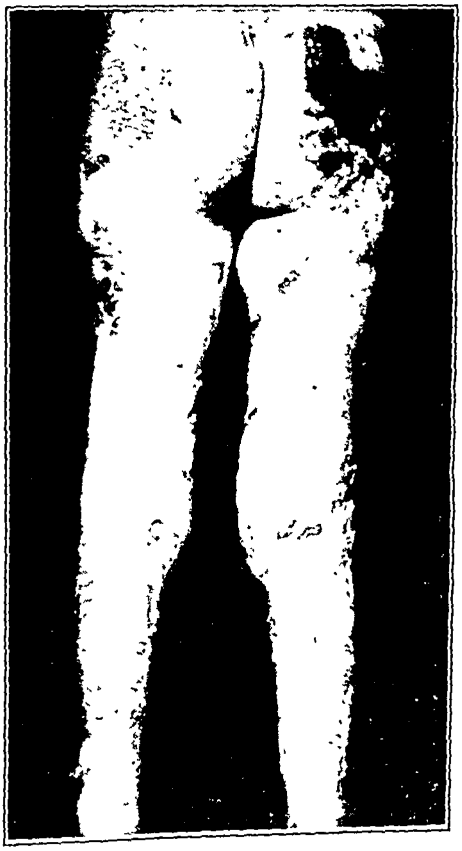

Fig. 4.—Posterior view eleven months after patient 1 was admitted. Ulcerated area on buttock healing rapidly.

Throughout this period all the patients experienced, at intervals, febrile episodes which usually responded to resumption of systemic penicillin and redressing. Cultures of the burned areas during these episodes usually showed hemolytic streptococci, and no grafting was attempted at these times.

RESULTS AT PRESENT

Patient 1 is now completely grafted, walking well and discharged fourteen months after admission. Patient 2 is now 75 per cent covered with grafts and is walking alone eight months after admission. Patient 3 (admitted six months after the burn) is progressing slowly, since he has been the most difficult to handle. His nutritional and vitamin state were extremely negative on admission, his morale low and his lack of appetite exasperating. For long periods small test grafts failed to live, and only in the past three months have we been able to proceed with grafts successfully. In general we have feared massive, one stage coverage grafts where the recipient areas were so huge (30 per cent of the body surface) and the donor areas so limited, since failure would be a catastrophe. His condition is gradually improving. Recent congo red determinations show a positive reaction only on this patient, patients 1 and 2 showing none. He is taking liver substance orally as advised by Jacobi and Grayzel[3].

Renal function on all 3 patients is not impaired.

CONCLUSION

Material made into clothing should be thoroughly tested as to inflammability before being offered for sale to the public.

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

Austin Smith, M.D., *Secretary.*

MERCUHYDRIN SODIUM SOLUTION.—Meralluride Sodium Solution.—A sterile aqueous solution containing in each cubic centimeter approximately 119 mg. of mercuhydrin and 13 mg. of theophylline, adjusted with sodium hydroxide to a p_H of about 7.5. Each 1 cc. of mercuhydrin sodium solution contains the equivalent of 39 mg. of mercury and 48 mg. of theophylline-U. S. P.

Actions and Uses: Mercuhydrin Sodium Solution is a mercurial diuretic claimed to be indicated in the edema of cardiorenal disease and of nephrosis, ascites of liver disease and other conditions in which a mercurial diuretic may be proposed.

It is claimed to be well tolerated systemically and significantly free from reaction at the site of injection when given intramuscularly. It is rapidly absorbed following intramuscular injection. It also is administered by intravenous injection.

The drug is contraindicated in acute nephritis and chronic kidney disease in which well defined tubular and glomerular changes are present. Since mercury is known to give rise in sensitive patients to side effects such as stomatitis, gastric disturbance, vertigo, febrile reaction and cutaneous eruptions, it is suggested that initial tests and careful regulation of dosage be followed when mercurial diuretics are used. During prolonged administration the urine should be examined periodically for albumin casts and blood cells.

Dosage.—Depending on the condition of the patient and route and the frequency of administration, the usual dose of Mercuhydrin Sodium Solution is from 1 cc. to 2 cc. In view of occasional cases of idiosyncrasy to mercurials, the initial dose could be 0.5 cc. or less. Subsequent injections may be given twice weekly, as indicated by the condition of the patient. One investigator has recommended smaller doses repeated at shorter intervals and emphasizes the importance of observing daily water balance instead of weekly observations.

Tests and Standards.—

Mercuhydrin sodium solution is clear, colorless to pale yellow and odorless and possesses a bitter taste. The p_H of the solution is between 7.4 and 7.6 at 25 C. Mercuhydrin sodium solution should be protected from light.

Five cubic centimeters of mercuhydrin sodium solution responds to tests for the presence of mercury, allylsuccinylurea and theophylline given under Mercuhydrin-N. N. R. Evaporate 1 cc. of mercuhydrin sodium solution to dryness in a tared porcelain dish and ignite: the residue responds to tests for sodium.

To 5 cc. of mercuhydrin sodium solution add 0.5 cc. of sodium acetate solution and 0.3 cc. of diluted acetic acid; dilute to 10 cc. with water and divide the solution into two portions. Add to one portion 0.2 cc .of sodium sulfide solution and compare with the other portion: only a very faint difference in coloration of the test solution is noticeable immediately.

Determine the mercury content of 2 cc. of mercuhydrin sodium solution, accurately measured, by the method given under Mercuhydrin-N. N. R.: the amount of mercury found is not less than 95 per cent nor more than 105 per cent of 39 mg. per cubic centimeter.

Determine the theophylline content of 5 cc. of mercuhydrin sodium solution, accurately measured, by the method given under Mercuhydrin-N. N. R.: the amount of anhydrous theophylline found is not less than 95 per cent and not more than 105 per cent of 43.6 mg. per cubic centimefer.

Lakeside Laboratories, Inc., Milwaukee

Solution Mercuhydrin Sodium: 1 cc. and 2 cc. ampuls.

MANNITOL HEXANITRATE (See New and Nonofficial Remedies, 1945, p. 334).

The following dosage form has been accepted:

William H. Rorer, Inc., Philadelphia

Tablets Mannitol Hexanitrate: 32 mg.

PENICILLIN (See New and Nonofficial Remedies, 1945, p. 214).

The following additional dosage form has been accepted:

Abbott Laboratories, North Chicago, Ill.

Penicillin Sodium Salt: 200,000 Oxford Unit vials.

Council on Foods and Nutrition

ACCEPTED FOODS

The following additional foods have been accepted as conforming to the Rules of the Council on Foods and Nutrition of the American Medical Association for admission to Accepted Foods.

James R. Wilson, M.D., *Secretary.*

PREPARATIONS USED IN THE FEEDING OF INFANTS (*See* Accepted Foods, 1939, p. 156)

Swift & Company, Chicago.

Swift's Meats for Juniors, including Diced Beef, Diced Pork, Diced Lamb, Diced Veal, Diced Beef Liver and Diced Calf Heart, are made from meats trimmed of fat, sinews and connective sheaths with added salt, prepared under inspection of the Meat Inspection Division of the United States Department of Agriculture.

Analysis (submitted by manufacturer).—

	Moisture, %	Protein, %	Fat, %	Ash, %
Diced beef	74.7	22.63	1.70	1.47
Diced pork	70.7	21.81	6.48	1.51
Diced lamb	74.3	18.19	6.3	1.41

SATURDAY, APRIL 6, 1946

RECURRENT MALARIA

Several thousand soldiers with recurrent attacks of benign tertian malaria were observed by four army medical officers[1] in a U. S. general hospital on a nonmalarial South Pacific island used as a rest area. Fifty soldiers were selected for complete organic and psychologic analysis. These men had been unable to return to combat because of chronic malarial symptoms and the frequency of recurrence (averaging ten attacks over a period of approximately one year). Suppressive therapy with atabrine had not influenced the recurrent course of the disease, although usual antimalarial therapy had readily controlled the severe paroxysms. The group was divided into approximately four equal categories as to state of physical condition and degree of adjustment so that the manifestations of the disease could be correlated. As a whole, the general white population of the army overseas in this area was approximated by the group in age (average 25 years), intelligence distribution and general state of health except for the effects of malaria.

The constancy of symptoms and the variability in physical reaction from severe debility to general good physical condition and the paucity of significant clinical features were impressive. Weight loss in excess of the controls was almost constantly present and was paralleled by the nutritional status and the degree of debility evident on inspection. Otherwise physical examination did not reveal abnormalities except for a palpable liver and spleen in a few cases. Extensive laboratory studies including tests of adrenal function did not show evidence of damage or dysfunction of the organ systems. Repeated malarial attacks and considerable amounts of atabrine had not apparently resulted in any physical impairment in this group other than debility.

Fatigability, the chief manifestation of the disease, was measured objectively by means of a running in place test and the Schneider index. Consistent differences in response were noted between the malarial and control groups, but individual comparisons were not possible because of the diversity of individual responses. The Rorschach technic objectively displayed mental apathy as an expression of fatigue and thus corroborated the clinical impression of lowered vitality, initiative and interest. Further investigation with this test in such cases would be desirable.

The characteristic symptomatology in these chronic malarial patients in intervals between attacks included weakness or fatigability 94 per cent, intolerance to heat 92 per cent, tension 78 per cent, chronic headache of tension type 65 per cent, exertional dyspnea 65 per cent, anorexia 45 per cent, insomnia 45 per cent, "blackouts" and palpitation 40 per cent, and splenic tenderness 27 per cent. From a correlation of these symptoms with physical condition, personality adjustment and malaria the authors concluded that "a considerable portion of the symptoms could be attributed to the recurrent attacks of malaria alone." The best adjusted and the least debilitated patients had relatively few complaints except weakness and fatigability after exercise. The patients who had adjusted poorly in civil or military life made poor adjustment to the recurrent attacks and became incapacitated early with a wide variety of symptoms. The adjustment of the individual to the stresses of illness and to concurrent situational factors contributed to the development, perpetuation and intensification of the symptoms of chronic malaria.

The authors emphasize that treatment should be directed to the person as a whole and not to the malaria alone. Such measures must include the prevention and control of the development of the debility and poor adjustment conducive to chronic symptoms. In military life a study of the entire reaction of the soldier is needed in determining proper duty status and assignment. Hospitalization should be minimized and proper recreation provided to reduce the tendency toward development of neurotic patterns. Thorough simple malarial instruction is essential. In both military and civil practice individual reassurance to patients is necessary to allay the common concerns of future permanent disability and ill health from recurrent malaria, which have arisen from ignorance and misconceptions of the effects of the disease.

The military value of these studies in the effective utilization and treatment of affected personnel is apparent. In addition, the problem of the chronic malarial patient will assume increasing importance in civil life as more and more men are demobilized who have acquired the disease while stationed in malarial areas throughout the world.

PAINFUL AMPUTATION STUMPS

Several methods to lessen the risk of development of painful amputation stumps are recommended in the Neurological Section of the Military Surgical Manual.[1] Among these are (*a*) alcohol injection of the nerve stump,[2] (*b*) excision of a wedge of the nerve end and suture of the flaps [3] and (*c*) a combination of the two procedures.[4] Other surgeons have suggested (*d*) cauterizing the end of the nerve with a high frequency current [5] and (*e*) burying the nerve stump in bone.[6] Since these procedures have not been universally effective, Poth and his associates [7] of the Surgical Research Laboratory, University of Texas, have restudied the problem on experimental animals.

In preliminary experiments a 2 cm. segment of the sciatic nerve was excised in a group of 9 dogs under anesthesia and the proximal stump replaced in its bed without further treatment. After periods varying from thirty to ninety days the animals were painlessly killed and the tissues examined. In all instances typical neuroma formation had occurred. In a second group of dogs the proximal nerve stump was injected with absolute alcohol. In all instances typical end-bulb neuromas had formed by the end of thirty days. In still other groups of dogs the proximal nerve stump was placed in a closed cellophane tube or an arterial sleeve or was inserted into a snugly fitting closed glass tube about 2.5 cm. long. In 11 dogs in which the nerve stump had remained within the glass tube there was no evidence of neuroma formation. In 5 of these dogs the observation period was as long as two hundred and thirty days.

From these experiments it appears that the growth pressure of nerve axons can be overcome by their complete isolation from surrounding nutritional factors. Since the glass tube technic is clinically inapplicable, Poth sought to accomplish the same axon inhibition by chemical means. He found that his selected chemical agent must not cause massive necrosis of the nerve, since massive necrosis was equivalent to a simple resection at a higher level. The ideal chemical agent would be one that would inhibit axon growth and at the same time stimulate the growth of surrounding fibrous tissues. This peripheral proliferation would form an enclosing fibrous tube whose lateral pressure might overcome the growth pressure of the regenerating nerve fibers. Poth found that tannic acid and gentian violet are the nearest approach to this ideal axon inhibitor.

To test these substances the proximal nerve stumps of 14 dogs were injected with either 0.5 cc. of 10 per cent tannic acid or 0.5 cc. of 2 per cent gentian violet. In no instance could the development of a neuroma be demonstrated in these dogs on their examination from thirty to ninety days later. The technic was therefore tried on 15 clinical patients. All of the severed nerves which could be identified during amputation of the lower extremity of these patients were injected. To make the injection, a tight rubber band or a small clamp was applied about 3 inches from the end of each severed nerve, and the end of the nerve was ligated with fine silk. Multiple injections were made into the isolated nerve segment, in most cases from 3 to 5 cc. 2 per cent gentian violet being used. The compression clamp or rubber band was then removed.

While the lapse of time is too short to draw final conclusions, the investigators report that patients have not thus far suffered untoward pain because of the procedure, nor has healing been compromised in any way. Poth and his associates hope that this method of preventing the formation of end-bulb neuromas may contribute to the solution of problems of the painful amputation stump and the phenomenon of the phantom limb.

STREPTOMYCIN

Recent reports concerning the value of streptomycin in the treatment of tularemia, influenzal meningitis and urinary infections have created widespread demand for this antibiotic preparation. Unfortunately streptomycin, or perhaps the impurities now present in many commercial preparations, have toxic potentialities. Two fatalities from histamine-like reactions are known to have occurred, eighth nerve damage has been reported and delayed fatty infiltration of the kidneys has been observed in animals following administration of streptomycin. Not all batches of this drug produce these reactions; however, only extensive and well controlled laboratory examinations of each batch can separate the harmful from the safe lots. In addition, the difficulties encountered in the production of streptomycin are greater than those encountered in the production of penicillin.

Because of the peculiar problems incident to the production of penicillin and because of the importance of the drug, Congress enacted special legislation to ensure the safety and efficacy of use of each batch of this drug. This legislation provides for certification of each batch of penicillin by the Food and Drug Administration before interstate distribution. Such legislation has not yet been enacted with respect to streptomycin. Temporary control is now exercised by the Civilian Production Administration General Allocation order M-300 as amended.

At a recent meeting of the Food, Drug and Cosmetic Section of the New York Bar Association a resolution was passed condemning further legislation designed to amend the Federal Food, Drug and Cosmetic Act to provide control over specific drugs. Such legislation does not seem desirable. The New Drug provisions of the Federal Food, Drug and Cosmetic Act might however be amended to provide for the certification of any new drug when the administrator of the Federal Security Agency, on adequate evidence, deems such certification necessary for the protection of the public health. Certainly the problems involved in the production and distribution of safe and efficacious batches of streptomycin are serious. The record of the Food and Drug Administration in ensuring a safe and efficacious supply of penicillin commends the procedure now in force for the control of this drug. Furthermore, since it is quite probable that new antibiotics will be discovered for which a form of predistribution control will be desirable, general legislation to provide a mechanism to meet this need as it arises appears to be highly desirable.

Current Comment

SIMPLE TEST OF BLOOD AMYLASE ACTIVITY IN PANCREATIC AND OTHER DISEASES

The exact chemical nature of amylase is not known. At present the amount of amylase in the blood under different conditions cannot be determined, but its amylolytic activity can be estimated more or less closely by various methods. Normally the amylase activity of the blood appears to remain within fairly constant limits. An increase occurs in the early stages of acute pancreatitis;[1] consequently estimations of the amylase activity may be helpful in the diagnosis of pancreatic and other diseases. A number of methods are available for that purpose, but as yet a reliable and simple method for routine work has not come into general use. The method worked out by Polowe[2] seems well suited for practical use at this time. He estimates the amylase activity of blood by the amount of sugar produced by plasma or serum in starch solution under standard conditions. After incubation of such a mixture for thirty minutes at 37.5 C. a small quantity of the mixture is added to copper solution (Benedict's), which is boiled and centrifugated. The resulting precipitate is compared with that in a control mixture with normal plasma or serum and subjected to the same treatment. The results are recorded in general terms as showing normal, decreased or increased amylase action. Polowe found this simple method valuable in the diagnosis especially of acute pancreatitis in which the amylase activity of blood was increased in the early stages. But increased activity was not pathognomonic of pancreatitis, as increase was found to occur in some cases of pneumonia, high intestinal obstruction, acute splenic trauma, duodenal ulcer, perforation of gastric ulcer and other conditions. Polowe also enumerates a number of conditions in which he found diminished amylase activity of the blood, but in no case was decrease associated with acute pancreatitis. He mentions especially that, in cases of epigastric pain or distress as the chief symptom, tests of blood amylase activity may prove a valuable diagnostic aid.

IMMERSION FOOT AND FROSTBITE

Patients with immersion foot or frostbite frequently have late complications which present problems of treatment, disability, evaluation and rehabilitation. These patients may have annoying complaints of a neuritic or vasospastic nature in addition to any disability caused by the loss of fingers or toes. There are disturbances of cutaneous sensations—anesthesia, hyperesthesia—or vasospastic symptoms such as hyperhidrosis, claudication, cyanotic attacks or ulceration. Deep pain or pain on use may be the principal disabling complaint. In 23 cases of immersion foot or frostbite Southworth[1] used sympathectomy in 4, alcohol sympathetic blocks in 9 and repeated procaine blocks in 4. Disturbances of cutaneous sensation, which are not especially disabling, were frequently relieved by temporary sympathetic block. However, when the symptoms were distressing and not relieved by alcohol blocks, sympathectomy provided relief. Alleviation of vasospastic symptoms was also provided by alcohol blocks. Since these symptoms regress spontaneously and may not become static for as long as eighteen months after injury, sympathectomy can be deferred. If thinning of the skin appears within the first three months, sympathectomy should be performed. Unfortunately the deep pain is not influenced by sympathectomy or alcohol block. In this small group of patients with immersion foot and frostbite sympathectomy has produced beneficial effects on certain late symptoms but does not relieve the deep pain or prevent partial disability.

EXTENSION OF INTERNSHIPS

The Procurement and Assignment Service reports that its office has been flooded with requests for extensions of internships to July 1, 1946. Early in January 1945 Directive 386 was distributed to all hospitals, stating specifically that each extension must be individually requested before February 1. The Procurement and Assignment Service now announces that it is not in a position at this time to ask cancellation of active duty orders and that even under circumstances of urgent and dire need, such as may be found in small hospitals, the Army and the Navy will not be able to give consideration to such requests at this late date.

MEDICINE AND THE WAR

VETERANS

APPOINTED CHIEF MEDICAL DIRECTOR OF DEPARTMENT OF MEDICINE AND SURGERY

Gen. Omar N. Bradley, administrator of veterans affairs, recently announced that Major Gen Paul R. Hawley retired from the Army, closing a career of twenty-nine years in the Army Medical Corps, to accept an appointment as chief medical director of the Department of Medicine and Surgery in the Veterans Administration

OPPORTUNITIES FOR RESIDENCY TRAINING

The Veterans Administration, Washington, D. C, recently announced that the selection of residents and the maintenance of standards of training has been vested in Dean's Committees of the medical schools which are affiliated with the Veterans Administration hospitals Applications should be made directly to these committees, a list of which follows

Veterans' Hospital at:	Chairman of Dean's Committee	Representing Medical Schools of
* San Francisco	Dr Howard C Naffziger University of California Medical School San Francisco 22	California Stanford
* Los Angeles	Dean Burrell O. Raulston University of Southern California Medical School 2551 University Avenue Los Angeles 7	Southern California Medical Evangelists
* Washington, D. C. (Mount Alto)	Dean Walter A. Bloedorn George Washington University School of Medicine 1335 H Street N W. Washington 5, D. C.	George Washington Georgetown
Indianapolis	Dr. Matthew Winters, secretary 23 East Ohio Street Indianapolis	Indiana
Chicago (Hines) (Vaughan)	Dean J Roscoe Miller Northwestern University Medical School 303 East Chicago Avenue Chicago	Illinois Northwestern Loyola
Excelsior Springs, Mo (tuberculosis only)	Dean Harry R Wahl University of Kansas School of Medicine 39th Street and Rainbow Blvd.	Kansas
Louisville, Ky. (Nichols General Hospital)	Dr Arnold Griswold University of Louisville School of Medicine 101 West Chestnut Street Louisville 2, Ky.	Louisville
New Orleans (LaGarde General Hospital)	Dean H W. Kostmayer Tulane University School of Medicine 1430 Tulane Avenue New Orleans	Louisiana State Tulane
* Baltimore (Fort Howard)	Dr. Perrin Long, secretary Johns Hopkins University School of Medicine 710 West Washington Street Baltimore 5	Johns Hopkins Maryland
Boston (West Roxbury)	Dean C. Sidney Burwell Harvard Medical School 25 Shattuck Street Boston 15	Boston Harvard Tufts
Dearborn, Mich.	Dean Hardy A. Kemp Wayne University College of Medicine Detroit 1	Wayne
Minneapolis	Dean Harold S Diehl University of Minnesota Medical School Minneapolis 14	Minnesota
New York (Bronx)	Dean Willard C Rappleye 630 West 168th Street New York 32	Columbia Cornell Long Island Medical College New York University New York Medical College
Oteen, N. C (tuberculosis only)	Dean Wilburt C. Davison Duke University School of Medicine Durham, N C	Duke
White River Junction, Vt.	Dean Rolf C Syvertsen Dartmouth Medical School Hanover, N. H.	Dartmouth
Cleveland (Brecksville)	Dean Joseph T. Wearn Western Reserve University School of Medicine 2109 Adelbert Road Cleveland 6	Western Reserve
Oklahoma City	Dean Wann Langston University of Oklahoma School of Medicine 801 Northeast 13th Street Oklahoma City 4	Oklahoma
* Portland, Ore.	Dean D W. E Baird University of Oregon Medical School Portland 1, Ore.	Oregon
Pittsburgh (Aspinwall)	Dean William S McEllroy University of Pittsburgh School of Medicine Bigelow Boulevard Pittsburgh	Pittsburgh
Nashville, Tenn (Thayer General Hospital)	Dean Ernest W. Goodpasture Vanderbilt University School of Medicine 21st Ave. South at Edgehill Nashville 4, Tenn.	Vanderbilt
Dallas, Texas (Lisbon) (Ashburn General Hospital)	Dean Tinsley R Harrison Southwestern Medical College 2211 Oak Lawn Dallas 4, Texas	Southwestern
Salt Lake City	Dr. H. L Marshall University of Utah School of Medicine Salt Lake City	Utah
Richmond, Va. (McGuire General Hospital)	Dean J P. Gray Medical College of Virginia Richmond, Va	Virginia
Wood, Wis	Dean Eben J Carey Marquette University School of Medicine 561 North 15th Street Milwaukee 3	Marquette
* Topeka, Kan.	Dr. Kurt Menninger Menninger Clinic Topeka, Kan	

---

* Neuropsychiatric residencies available

At the present time practically all the hospitals listed offer residency training in internal medicine, general surgery, radiology and pathology. Some of them can also provide training in orthopedics and urology. The respective specialty boards have assured their provisional approval of these programs, but it is to be understood that full accrediting cannot be granted until the plan is in operation and the hospitals have been inspected Training in the subspecialties of internal medicine and the surgical specialties, including ophthalmology and otolaryngology, will be offered wherever it is possible to provide adequate material and qualified supervision It is unlikely that training can be provided in gynecology.

Training in the fields of tuberculosis and neuropsychiatry is also available Several residencies in tuberculosis are indicated, and inquiries concerning other opportunities should be addressed to Dr. John Barnwell, acting assistant director of Tuberculosis Service, Veterans Administration, Washington, D. C. Information concerning training in neuropsychiatry may be obtained from Dr. Daniel Blain, acting assistant director of Neuropsychiatric Service, Veterans Administration, Washington, D. C.

The list of dean's committees includes only those whose organization has progressed to the point where they are ready to accept applications for residencies Additional openings will be available within a short time as the program develops.

DISABLED VETERANS TO TRAIN FOR SKILLED JOBS

Dr. Paul R. Hawley, chief medical director of the Veterans Administration, recently announced the first industrial agreement to train severely disabled veterans in Veterans Administration hospitals for skilled and semiskilled jobs. The Bulova School of Watchmaking, Woodside, L. I., N. Y., will conduct the program under arrangements negotiated by Dr. Donald A. Covalt, acting assistant director of Veterans Administration Medical Rehabilitation, and Stanley Simon, trustee of the Bulova school.

"Severely disabled veterans who have a special aptitude for precision work will be given an opportunity for this training," Dr. Hawley stated. The training course will be tailored to each patient's individual work tolerance, Dr. Covalt said. He added that a veteran may work only an hour a day if that is all the time he can spend at the training without endangering his health.

Although there is no set time for the handicapped veteran to complete the course, Veterans Administration officials said it probably would take about a year; if the veteran does not complete his training while still in a Veterans Administration hospital, he can go to the Bulova School of Watchmaking on Long Island.

The work will be conducted principally in the seven paraplegic or spinal cord injury centers which the Veterans Administration is in the process of setting up or taking over from the Army. However, other severely handicapped veterans will participate in the program.

Approximately 400 paraplegics are in Veterans Administration hospitals at present, but some 1,600 more who are now in army and navy hospitals will be transferred to the Veterans Administration in the near future. The seven centers include five operated by the armed services that will be taken over intact and two Veterans Administration hospitals which have specific facilities for such patients.

These paraplegic centers will be in Framingham, Mass.; New York City (Bronx Veterans Administration Hospital); Richmond, Va.; Memphis, Tenn.; Pittsburgh (Aspinwall Veterans Administration hospital); Chicago, and Los Angeles.

PRIVATE MENTAL HYGIENE CLINICS

The Department of Medicine and Surgery has received inquiries as to whether the Veterans Administration will cancel contracts with private mental hygiene clinics for the outpatient treatment of veterans when the Veterans Administration Mental Hygiene Clinics are organized and functioning. This has resulted in besitancy on the part of some clinics to negotiate contracts.

In respect to these inquiries, it is the policy of the Veterans Administration to continue all such contracts indefinitely, provided the caliber of work justifies their continuation.

SPECIAL CENTER FOR TUBERCULOSIS

Pending expansion of Veterans Administration facilities for the care of tuberculous patients, Moore General Hospital, Swannanoa, N. C., has been designated as a specialty center for tuberculosis. The large number of examinations at separation centers has led to the discovery of cases of tuberculosis at a rate temporarily exceeding the capacity of Fitzsimons and Bruns general hospitals and tuberculosis hospitals of the Veterans Administration.

APPOINTED TO VETERANS ADMINISTRATION

Dr. Karl M. Bowman, professor of psychiatry in the University of California Medical School, San Francisco, has been appointed consultant in neuropsychiatry for Branch 12 of the Veterans Administration. He will supervise neuropsychiatric activities of the Veterans Administration in California, Arizona and Nevada.

APPOINTED HEAD OF VETERANS HOSPITAL AT NEWINGTON, CONN.

Dr. Lewis G. Beardsley was recently appointed head of the Newington Veterans' Facility, succeeding Myer Schwolsky, who will remain in office as manager of the Hartford Regional Office of the Veterans Administration. Dr. Beardsley was formerly manager of the Diagnostic Center in Washington, D. C.

ARMY

COMMISSION APPOINTED TO STUDY PROSTHETIC PROGRESS IN EUROPE

Five army and civilian experts comprising a commission on prosthetic devices will leave Washington soon for a study of European technics in amputation surgery, developments in the field of prosthetics and artificial limbs, and the rehabilitation and reconditioning of amputees. The commission is being sent by Major Gen. Norman T. Kirk, Surgeon General of the Army, at the direction of Secretary of War Patterson. It will visit scientific centers in England, France, Switzerland, Germany, Sweden and possibly Russia. Heading the unit is Col. Leonard T. Peterson, Medical Corps, of Washington, D. C., chief of the amputation and prosthetic unit, Surgeon General's Office. Other members are Dr. Paul E. Klopsteg, director of research at the Northwestern University Technological Institute; Lieut. Col. Robert G. F. Lewis, Ordnance Department of New York City, engineer assigned to the Surgeon General's Office; Lieut. Col. Rufus H. Alldredge, Medical Corps, of New Orleans, chief of the amputation section, England General Hospital, Atlantic City, N. J., and Mr. Edmond N. Wagner of San Marino, Calif., consulting engineer. Dr. Klopsteg is chairman of the Committee on Prosthetics of the National Research Council. Mr. Wagner formerly was chief of the engineer section of the Office of Scientific Research and Development. Technician Third Grade John P. Gavell, Medical Department, of Danbury, Conn., will accompany the group as recorder.

For several months members of the commission have been making preliminary investigations of the latest technics in amputation surgery and developments in prosthetic devices, particularly those developed by German scientists which were unavailable for study during the war.

One of the types of surgery to be investigated is cinoplastic surgery, which involves connection of the activating cords of the artificial limb to the muscles by means of pins made of inert or nonirritating material. The pin is inserted through the skin lined tunnel in the muscle. While this treatment has been used to some extent in treatment of amputees, the commission hopes to find means of improvement to increase the utility of the artificial limb. Research is now conducted which suggests that cinoplastic surgery may be extensively applied in prostheses in the near future.

COMMANDER OF SEVENTH INFANTRY DIVISION'S MEDICAL BATTALION

Capt. Albert Rosner, formerly of Camden, N. J., was recently named commander of the Seventh Infantry Division's medical battalion. For medical work with front line troops he was awarded the combat stars in the Philippine and Ryukyus Island battles and the combat medical badge for Okinawa. Dr. Rosner graduated from Hahnemann Medical College and Hospital of Philadelphia in 1941 and entered the service Aug. 1, 1942.

TILTON GENERAL HOSPITAL COMMENDED

The Meritorious Service Plaque was recently awarded to Tilton General Hospital, Fort Dix, N. J., for the superior manner in which the men's detachment and the three WAC companies discharged their responsibilities. All during the time Tilton Hospital was active the enlisted and WAC units maintained the highest professional standards in the receiving, treating and disposition of patients, and in addition they rendered valuable service in the medical training programs conducted there by the Army.

ARMY AWARDS AND COMMENDATIONS

Captain John R. Bobb

The Bronze Star was recently presented to Capt. John R. Bobb, Lykens, Pa., "for heroic achievement in action in the vicinity of Oberzerf, Germany, on March 13, 1945. Captain Bobb was on reconnaissance patrol in the town when a soldier received a serious sucking wound in the chest. Without regard for his own personal safety, Captain Bobb proceeded alone approximately 100 yards to give the man immediate aid and successfully evacuated him to the aid station for further treatment. Later during an intense artillery barrage Captain Bobb again left shelter to aid men wounded by shell fragments. During the intense fire his aid station was kept in constant operation in spite of a direct rocket hit and, having no assistant battalion surgeon, Captain Bobb personally maintained liaison with his battalion. Captain Bobb's courage and aggressiveness greatly aided in saving the lives of numerous men and to the success of his battalion." Dr. Bobb graduated from Temple University School of Medicine in 1942 and entered the service Aug. 13, 1943.

Colonel Joseph Berkson

The Legion of Merit was recently awarded to Col. Joseph Berkson, Rochester, Minn., head of the Section on Biometry and Medical Statistics of the Mayo Clinic. "As chief of the statistics division, office of the air surgeon, headquarters army air forces," according to the citation, Colonel Berkson "contributed immeasurably to the advancement of medical statistics in developing new methods of presenting and interpreting statistical data as applied to army air force matters. His display of professional skill and high standards of efficiency in disease control contributed to a great extent to the success of the army air forces health programs." Dr. Berkson graduated from Johns Hopkins University School of Medicine, Baltimore, in 1927 and entered the service May 12, 1942.

Major John J. McAleese

John J. McAleese, Pittsburgh, was recently awarded the Legion of Merit for "instituting a comprehensive research program which evolved the 'kleenex-penicillin' treatment for burns, officially recognized as superior to any other treatment known to medical science and particularly successful in tropical climates. This new method resulted in economy of materials, reduced sepsis (infection), it alleviated suffering and expedited healing in numerous cases. Through extensive use of the treatment, hospitalization and lost time were materially shortened." Dr. McAleese graduated from the University of Pittsburgh School of Medicine in 1935 and entered the service July 15, 1942.

Colonel Aubrey Kenna Brown

Col. Aubrey Kenna Brown (retired), McAllen, Texas, was recently awarded the Legion of Merit for the professional and administrative ability which he displayed as commanding officer, Regional Hospital, Camp Swift, Texas, from March 1942 to November 1945. The citation called attention to the fact that "the reconditioning program for return to duty or civil status of convalescent soldiers and the program of training for medical units for overseas service, organized and supervised by Colonel Brown, were particularly valuable and reflected his keen devotion to the welfare of the sick and wounded." Dr. Brown graduated from Bennett College of Eclectic Medicine and Surgery, Chicago, in 1912 and entered the service July 1, 1920.

Captain Richard J. Cross

Capt. Richard J. Cross, New York, was recently awarded the Bronze Star "for meritorious service in connection with military operations against the enemy on Leyte during the Ormoc Bay campaign." Dr. Cross graduated from Columbia University College of Physicians and Surgeons, New York, in 1941 and entered the service Oct. 1, 1942.

Lieutenant Colonel Norman Q. Brill

The Legion of Merit was recently awarded to Lieut. Col. Norman Q. Brill, deputy director of the neuropsychiatry consultants division, Office of the Surgeon General, for his work in "organizing the treatment program for psychiatric patients in convalescent hospitals, one of the notable therapeutic achievements of the Medical Department in this war." The citation further stated that "through superior professional ability, excellent planning and broad experience he initiated numerous significant and highly important policy changes with regard to the salvage of manpower, management of psychiatric casualties and dispositional procedures. His unusual judgment of relative values, keen perspicacity and untiring devotion to duty contributed materially to the achievements of the Neuropsychiatry Consultants Division, reflecting great credit on himself and on the Medical Department." Dr. Brill graduated from the New York University College of Medicine, New York, in 1934, was commissioned in the Army Medical Reserve Corps in June 1934 and went on active duty in April 1941.

Colonel Albert E. McEvers

Col. Albert E. McEvers, commanding officer of Kennedy General Hospital, Memphis, Tenn., was recently awarded the Legion of Merit. According to the citation accompanying the award, "Colonel McEvers, as commanding officer, from March to September 1945, demonstrated exceptional qualities of leadership and administrative ability in supervising an extensive expansion of facilities to take care of a greatly increased patient load. Under his capable direction the work of this hospital in the treatment of all types of overseas casualties was outstanding and reflected great credit on the Medical Department of the Army." As reserve officer, Colonel McEvers served with the Medical Corps in France during the first world war. On his return to the United States in 1918 he was commissioned a major in the Medical Corps of the Officers' Reserve Corps. He was appointed a full colonel in the Reserve Corps in 1934 and again in December 1939, since which time he has been on active duty. Dr. McEvers graduated from the Chicago College of Medicine and Surgery in 1912.

Captain Richard G. Fort

The Bronze Star was recently awarded to Capt. Richard G. Fort, Evanston, Ill., for his work from July 14 to Aug. 25, 1944. According to the citation accompanying the award, "Captain Fort enabled his medical battalion to provide efficient medical service for the sick and wounded of the division, maintaining superior liaison of widely separated subordinate units. Captain Fort often traveled far in advance of the medical battalion to reconnoiter sites for installations, necessitating long rides day and night under trying conditions. His profound knowledge of medical battalion functions and his efficient performance of duties reflect great credit on himself and on the medical corps." Dr. Fort graduated from the University of Illinois College of Medicine, Chicago, in 1939 and entered the service March 31, 1941.

Lieutenant Colonel Charles R. Rein

The Legion of Merit was recently presented to Lieut. Col. Charles R. Rein, New York, who, the citation said, "expanded and developed the serological service of the Army Medical Department while a member of the Army Medical School from November 1942 to October 1945. His establishment of a consultation service expedited investigative studies and the treatment of venereal disease." Dr. Rein graduated from the University of Michigan Medical School, Ann Arbor, in 1928 and entered the service Aug. 12, 1942.

Captain Carl E. Billings

Capt. Carl E. Billings, Barrington, Ill., was recently awarded the Bronze Star for meritorious service performed in combat operations against the enemy in Belgium and Germany during the first part of the year 1945. Captain Billings' services resulted in the saving of many lives which otherwise would have been lost. Dr. Billings graduated from the University of Chicago School of Medicine in 1942 and entered the service July 1, 1943.

Major Raymond J. Byron

Major Raymond J. Byron, Schenectady, N. Y., was recently awarded the Legion of Merit "for exceptionally meritorious conduct in the performance of outstanding services with the Fifth Army." Dr. Byron graduated from Albany (N. Y.) Medical College in 1938 and entered the service June 19, 1942.

MISCELLANEOUS

DR. FLOYD S. MARKHAM AWARDED AMERICAN TYPHUS COMMISSION MEDAL

Floyd S. Markham, Ph.D., of the department of bacteriology of Ohio State University, Columbus, was recently awarded the Army Typhus Commission Medal. He was a member of the Rockefeller Foundation Typhus team which worked with the Army in control of the threatened epidemic in Naples. He was stationed first in North Africa and then in Italy with the Rockefeller group, the Army and the Allied Control Commission, "rendering exceptionally meritorious service in connection with the control of typhus." According to the citation Dr. Markham, following the task in Naples, did considerable research on the vital statistics of the epidemic and compiled valuable scientific data showing the history of the epidemic. "He played an important part in a great modern achievement in preventive medicine," the citation states.

HOSPITALS NEEDING INTERNS AND RESIDENTS

The following hospitals have indicated to the Council on Medical Education and Hospitals that they have not completed their house staff quota allotted by the Procurement and Assignment Service:

INDIANA

St. Joseph Hospital, Fort Wayne. Capacity, 350; admissions, 6,950. Sister M. Geroldine, Superintendent (4 interns; resident—pathology).

Memorial Hospital, South Bend. Capacity, 275; admissions, 9,180. Mr. A. J. Sullivan, Administrator (interns; residents—mixed service, July 1).

KENTUCKY

Jewish Hospital, Louisville. Capacity, 100; admissions, 3,479. Mr. E. D. Witham, Superintendent (resident—mixed service).

LOUISIANA

U. S. Marine Hospital, New Orleans. Capacity, 572; admissions, 6,939. Dr. J. M. Lubitz (resident—Pathology).

MASSACHUSETTS

Wesson Memorial Hospital, Springfield. Capacity, 112; admissions, 3,022. Mr. J. M. Dunlop, Superintendent (intern; residents—mixed service).

NEW JERSEY

Hackensack Hospital, Hackensack. Capacity, 300; admissions, 9,360. Mrs. Mary Stone Conklin, R.N., Superintendent (3 residents—mixed service, July 1, discharged medical officers).

NEW YORK

Deaconess Hospital, Buffalo. Capacity, 344; admissions, 7,010. Mr. Vernon A. Reed, Superintendent (2 interns).

OHIO

St. Luke's Hospital, Cleveland. Capacity, 375; admissions, 10,526. Dr. F. G. Carter, Superintendent (resident—otolaryngology).

TEXAS

El Paso City-County Hospital, El Paso. Capacity, 211; admissions, 2,441, Colonel George W. Cook (U. S. Army, retired), Superintendent (3 interns, July 1).

VIRGINIA

Grace Hospital, Richmond. Capacity, 110; admissions, 4,026. Mr. R. H. Thomas, Managing Director (2 residents—mixed service).

WASHINGTON

Northern Permanente Foundation, Vancouver. Capacity, 360; admissions, 11,087. Dr. J. W. Neighbor, Medical Director (resident—surgery).

WEST VIRGINIA

Wheeling Hospital, Wheeling. Capacity, 270; admissions, 6,287. Sister Mary Ruth, Administrator (interns; residents—mixed service, July 1. Women interns considered).

APPOINTED SURGEON GENERAL OF SELECTIVE SERVICE SYSTEM

Col. Richard Henry Eanes, in addition to his other duties, was recently appointed Surgeon General of the Selective Service System, Washington, D. C. Dr. Eanes graduated from the Medical College of Virginia, Richmond, in 1911 and entered the service July 1, 1920.

UNRRA NEWS

Ask Help in Relieving Shortage of Bread Grains

The director general of the United Nations Relief and Rehabilitation Administration, Herbert H. Lehman, recently appealed to the United Nations Assembly for help in relieving the grave situation arising from the critical world shortage of bread grains, rice and fats.

The director general called attention to steps already taken by the governments of Australia, Canada, the United Kingdom and the United States to improve the situation but declared that, despite these measures, UNRRA thus far has been unable to receive assurance of sufficient supplies to meet even the most urgent needs of the receiving countries for grains and fats.

In a cablegram addressed to Trygve Lie, secretary general of the United Nations Organization, Mr. Lehman asked the assembly to take "such action as may seem fit and as may prompt the supplying countries to increase their exports and the consuming countries to utilize their imports and indigenous supplies in the wisest manner possible." He stated also that he made public appeals to the people of the supplying nations and called for further sacrifices to forestall the tragic fate facing the millions of people in Europe and Asia.

The director general informed the assembly of recommendations which had been made by the UNRRA council's committee on supplies and which included (1) that the governments concerned be urged to reconsider most urgently the decision taken in mid 1945 to remove wheat and flour from international allocation, (2) that the Cereals Committee of the Combined Food Board, in making allocations or programing exports of wheat and flour, take into consideration the extent to which the claimants have followed the example set by UNRRA in making the maximum substitution of other cereals for wheat and (3) that supplying governments make available and intergovernmental allocating agencies recommend allocations of additional quantities of wheat, rice, fats and other foods for countries receiving UNRRA assistance, even though such action may necessitate some further sacrifices.

The director general submitted records to show that allocations of bread grains, rice and fats were entirely inadequate to meet UNRRA's basic requirements.

Czechoslovakian Hospitals Given Medical Supplies

All hospitals and medical institutions in Czechoslovakia recently received their medical supplies from UNRRA. UNRRA now provides 10 per cent of all medical supplies used in Czechoslovakia. The Ministry of Health allocates the UNRRA contribution to medical institutions and supplies pharmacists, who sell to the general public from accumulated reserves or from German stores taken at the time of the May revolution.

The greatest problem in medical supply in Czechoslovakia, it is said, is the shortage of insulin. There are 6,000 persons with diabetes in Bohemia and Moravia who need permanent treatment; they require 8,000,000 units of insulin monthly, but Czechoslovakia manufacturers have facilities to manufacture only 1,000,000 units.

In May 1945 the United Kingdom supplied enough material to permit the manufacture of 10,000,000 units. Since then UNRRA has supplied Czechoslovakia with enough crystallized insulin to enable manufacturers to make 30,000,000 units. A recent agreement with Denmark provides that in exchange for a quantity of pancreas Denmark is to deliver 40,000,000 units to Czechoslovakia. There is enough insulin in the country at present to treat diabetic patients for nine months. The Ministry of Health is working out plans to increase the monthly production of insulin to 5,000,000 units by the time the present reserve is exhausted.

Czechoslovakia, which prior to the war imported most generally known medicines and the raw materials to manufacture them from Germany, is now making efforts to obtain these supplies from firms in England, the United States, Switzerland or France.

PHYSICIANS SEPARATED FROM SERVICE

ARMY MEDICAL CORPS OFFICERS RECOMMENDED FOR/OR RELIEVED FROM ACTIVE DUTY

Alabama

Di Tata, D., Major, 602 Norman Bridge Rd., Montgomery.
Henderson, Andrew D., Major, 259 St. Francis St., Mobile.
Huey, Thomas F. Jr., Lt. Col., 801 Glenwood Terr., Anniston.
Hunter, John W. Jr., Major, 3412 Montevallo Rd., Birmingham.
Weil, C. K., Major, Rt. 4, Box 343, Cook's Rd., Montgomery.

Arizona

Bate, Thomas H., Lt. Col., 15 E. Monroe Ave., Phoenix.
Kaufman, Jack, Capt., 2711 E. Lee St., Tuscon.
Mills, Charles S., Major, 361 E. Alvarado Rd., Phoenix.
Smith, Leslie B., Lt. Col., Grunow Clinic, Phoenix.
Stanley, John F., Major, 167 E. 3rd St., Yuma.

Arkansas

Blanton, Martin E., Capt., 404 Jefferson, Jonesboro.
Cohen, Louis A., Major, U. S. Vet. Hosp., North Little Rock.
Etter, Roscoe, Lt. Col., Veterans Admin., Fayetteville.
Finney, Charles H., Major, 622 Belle Ave., Ft. Smith.
Hairston, Glenn G., Major, Prescott.
Hanchey, Carl C., Major, DeQueen.
Hassell, Lyle L., Capt., Conway.
Jackson, Ulys, Capt., 412 E. Kentucky St., Blytheville.
Lee, Walter J., Major, 824 Oak St., Hot Springs National Pk.
Lyons, Virgle E., Capt., 118 Franklin St., North Little Rock.
Sheppard, Julius K., Capt., 1111 W. Main St., El Dorado.
Teeter, Brooks R., Major, 803 S. Erie St., Russellville.

California

Abramson, Arthur J., Capt., 356 26th Ave, San Francisco.
Ackert, Joseph W., 1st Lt., Route 1, Box 29C, Atascadero.
Alsberge, Edward W., Major, 1636 Allen Ave., Glendale.
Barnhill, John R., Capt., Kern County Hosp., Bakersfield.
Billingsley, Gordon D., Capt., 406 Orange St., Los Altos.
Chalian, Alexander R., Capt., 2533 Havenscourt Blvd., Oakland.
Coffelt, Ralph W., Lt. Col., 4614 Sunset Blvd., Los Angeles.
Cormia, Frank E., Capt., 450 Sutter St., San Francisco.
Custer, Clarence P., Major, 408 E. Geary St., Stockton.
Hong, Charles J., Capt., 1602 North St., Bakersfield.
Hudson, Charles B., Major, Alameda County Hosp., Oakland.
Lamke, Charles M., Capt., 3706 Oakwood Pl., Riverside.
Layman, John D., Capt., 232 E. Cleveland Ave., Montebello.
Loutzenheiser, John J., Lt. Col., 8 16th Ave., San Francisco.
Mathewson, Carleton, Jr., Lt. Col., 3975 Clay, San Francisco.
Matson, James R., Major, 3604 Granada Ave., San Diego.
Meyer, Morton A., Major, 1373 3rd Ave., San Francisco.
Murphy, Morton J., Major, Redding.
Muskin, Nathan, Major, 420 S. Westlake Ave., Los Angeles.
Newbill, James, Capt., Santa Clara County Hosp., San Jose.
Northway, F. J., Capt., 2266 Vallejo St., San Francisco.

ORGANIZATION SECTION

Council on Medical Service and Public Relations

MEETING OF FEBRUARY 13 AND 14, 1946

The meeting of the Council on Medical Service and Public Relations was called to order by the chairman, Dr. E. J. McCormick, Toledo, Ohio, in the Council office, American Medical Association, Chicago.

Council members present were Dr. Olin West, Headquarters; Dr. A. W. Adson, Rochester, Minn.; Dr. James R. McVay, Kansas City, Mo.; Dr. R. L. Zech, Seattle; Dr. Louis H. Bauer, Hempstead, L. I., N. Y.; Dr. Walter B. Martin, Norfolk, Va.; Dr. T. A. McGoldrick, Brooklyn, and Dr. Joseph S. Lawrence, Washington, D. C.; Mr. Thomas A. Hendricks, secretary, and Mr. George W. Cooley, assistant.

Others present during part of the meeting were Dr. Carl Peterson, Secretary, Council on Industrial Health; Dr. A. J. Offerman, president, Nebraska Medical Service, Omaha; Dr. F. L. Feierabend, secretary, Surgical Care, Inc., Kansas City, Mo.; Dr. F. F. Borzell, vice speaker, House of Delegates, American Medical Association, Philadelphia; Mr. Jay Ketchum, executive vice president, Michigan Medical Service, Detroit; Mr. MacCahal, executive secretary, American College of Radiology, Chicago, and Mr. J. W. Holloway Jr., Director, Bureau of Legal Medicine and Legislation, Chicago.

Report on Associated Medical Care Plans, Inc.—Mr. Jay Ketchum gave an account of the meeting on Tuesday, February 12, attended by fifty representatives of various prepayment medical care plans. It was explained that, as a result of the joint executive committee meeting of the Board of Trustees and the Council on Medical Service and Public Relations held Jan. 11, 1946, the officers of the Medical Service Plans Council of America had called a meeting of plan representatives to discuss a possible reorganization of this group. At this meeting held on February 12 a revised constitution and by-laws was drawn up and adopted under the new name of Associated Medical Care Plans, Inc. The officers of the association were instructed to proceed immediately with incorporation in the state of Illinois. The purpose of this new group as stated by Mr. Ketchum and Dr. Feierabend is to act as a clearing house for certain types of administrative information for the plans themselves, to assist the plans in obtaining some uniformity in their contracts and to work with the Council on Medical Service and Public Relations in coordinating and encouraging existing plans and assisting in the development of plans where they do not now exist.

Under the proposal, Associated Medical Care Plans, Inc., is to be directed by a commission of not less than thirteen and not more than twenty persons. The majority of this commission must be members of the American Medical Association, three of whom shall be members of the Council on Medical Service and Public Relations.

Discussion resulted as to the need for such an organization as Associated Medical Care Plans, Inc. Several Council members expressed the opinion that it merely duplicated the functions of the Council and that the responsibility for this work lay on the American Medical Association rather than on an outside organization. Assurance was given, however, that Associated Medical Care Plans, Inc., is to be an organization of administrators only, to assist one another in detailed administrative work and to assist the Council on Medical Service and Public Relations in the overall job of coordinating existing plans and developing new plans.

In executive session the Council discussed the relationship between Associated Medical Care Plans, Inc., and the American Medical Association.

Suggested standards for the acceptance of prepayment medical care plans and the standards of acceptance for prepayment medical care plans were discussed and approved as amended. These standards are to be used by the Council to grant the official seal of the Council to such plans as qualify within the standards set forth.

Recommendations to the Board of Trustees.—The following statement was prepared for the joint meeting of the Council on Medical Service and Public Relations and the Board of Trustees to be held February 14.

"The Council on Medical Service and Public Relations recommends the employment of a Director of its Division of Prepayment Medical Care Plans and the necessary staff. It also is recommended that the Council appoint an Advisory Committee representing medical care plans and their associations.

"The Council has determined standards for medical care plans, a copy of which is attached. Plans which meet these standards shall be entitled to the use of the Council Seal during the period of their approval.

"The Director of the Division of Prepayment Medical Care Plans of the Council on Medical Service and Public Relations with his staff and with the assistance and cooperation of the Advisory Committee, the state medical societies and Associated Medical Care Plans, Inc., shall be available to assist in developing plans, increasing the number of persons covered by already existing plans and facilitating reciprocity among them.

"The Council believes that responsibility for the development of medical care plans rests with state and county medical societies. Stimulation, coordination and the federation of such plans under the instructions of the House of Delegates is deemed to be the function of the Council on Medical Service and Public Relations and the Board of Trustees of the American Medical Association.

"The duty of the Advisory Committee shall be to advise the Director of Prepayment Medical Care Plans and the Council on the methods of implementing the program and, on approval of the Council, the Director of Prepayment Medical Care Plans will undertake the functions described in paragraph 3.

"The Advisory Committee shall consist of five members, appointed for one year. For the first year it is suggested that the following comprise the committee: Mr. Jay Ketchum, Dr. F. L. Feierabend, Dr. Herbert Bauckus, Mr. William Bowman and Mr. Charles Crownhart.

"A tentative cost of this program is estimated at $50,000 for the first year."

The Council also brought to the attention of the Board of Trustees the following proposals originally made to the executive committee of the Board of Trustees on January 11:

"1. A letter to the plans now in operation explaining the program of the Council and asking for specific information and data as a preliminary report and requesting suggestions as to future regular reports.

"2. Release of a monthly news letter on prepayment plans' activities to which all plans be invited to submit news items and articles.

"The use of such space as is necessary in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION to set forth pertinent and interesting information of the prepayment medical plans.

"3. Publication of an official roster of medical society sponsored and approved plans, including pertinent information on each.

"4. The adoption of a common symbol or trade mark for the use of the medical societies sponsored and approved plans.

"5. The establishment of an Advisory Service within the Council on Medical Service and Public Relations to provide speakers and technical advisers in relation to matters of organization and administration for county and state medical societies in the formation of plans, such speakers and advisers to be designated by the Council on Medical Service and Public Relations."

Several of these items are already being carried out, and steps are being taken to carry out the others. The Council proposed that the following additional recommendations be approved as part of the program:

1. Establishment of a public relations and press division of the Council on Medical Service and Public Relations to supply the national press through the present A. M. A. Public Relations Department with specific items and stories concerning the various plans for prepayment care, both on national and on local levels.

2. Preparation of literature, speeches, and so forth for representatives on the Council.

3. Preparation of excerpts from the News Letters and bulletins to be given to the press by the A. M. A. Public Relations Department.

4. Preparation of pamphlets for speeches with help of the Bureau of Medical Economics.

It was recommended that state societies and medical care plans be kept informed of the action taken in Michigan, California, Kansas and New Jersey regarding veterans' care and that they be urged to consider taking similar action, and that a copy of Col. J. C. Harding's statement made at the recent state secretaries' conference be attached to the letter for their information.

In accord with the recommendation by the Advisory Committee the Council is to encourage and assist local plans in development of arrangements for care of indigents and others entitled to public assistance, to provide adequate care, of good quality for such persons, with free choice of physician. As this has already been endorsed by the House of Delegates, the Council urged that the care of the indigent be done through medical care plans and put into action wherever possible. Plans now in operation are to put it into effect as soon as possible.

The Council further recommended the creation of a national insurance program to supplement the activities that are at present being carried on by the individual state, county and city plans but not to interfere with any of the present plans. It recommended that it proceed with a national insurance company in the manner suggested by Mr. Don Hawkins whereby the American Health Insurance Corporation would be used as the vehicle to carry out the activities in each state in agreement with the individual states; that the members of the medical profession form a holding company as provided in Mr. Hawkins' suggestions such persons to be selected by the Board of Trustees and the Council on Medical Service and Public Relations. It was stated that the plan can be put into effect in less than ninety days. It further recommended that, in the event the Board of Trustees rejects the proposals made by the Council relative to using the American Health Corporation as a vehicle for establishing a national insurance program, the Trustees should endorse and support a national insurance company sponsored and in cooperation with outside groups by contributions from various medical societies and the American Medical Association.

The Council recommended to the Board of Trustees that a representative from the Board of Trustees and/or the Council on Medical Service and Public Relations be appointed to act in an advisory capacity to any group or groups interested in introducing legislation affecting the health of the American people.

Regional Conferences.—Mr. Hendricks gave a report of the Middle Atlantic and New England regional conferences.

National Health Congress.—A letter from Mr. Harvey Sethman of Colorado, secretary-treasurer of the Conference of State Medical Society Presidents, was read. In the letter Mr. Sethman urged the Board of Trustees to take action with reference to the formation of a national health congress as proposed in the resolution adopted by the House of Delegates. It was generally agreed that the matter should be turned over to a subcommittee and Mr. Hendricks for further contact with the presidents of the various state medical associations to ascertain whether or not they have such a health congress in their various states and whether or not they would be willing to form one. It was felt that such a program should originate on the state level, and that at such time as it is well organized the Council should hold a national meeting in Chicago.

Public Relations for State and Local Medical Societies.—Mr. Hendricks suggested that it might be well to assist state and local societies in the development of public relations by preparing a brochure on public relations and by preparing a complete bibliography covering both the general and specific fields of public relations and publicity.

Health Insurance Kits.—Because of the many requests for material on compulsory health insurance, it was suggested that the Council prepare kits for the various state and local medical officers and for officers of the Woman's Auxiliary.

Expression of Condolence to Mrs. W. S. Leathers.—The Council voted unanimously to express its sorrow and loss at the death of Dr. W. S. Leathers, former member of the Council, and requested Mr. Hendricks to convey the expression to Mrs. Leathers.

PREPAID MEDICAL CARE NEWS

United Medical Service, Inc., Broadens Contract

A more liberal contract has been announced by United Medical Service, Inc., 370 Lexington Avenue, New York City. Under the new provisions small employed groups and individuals not affiliated employers already under U. M. S. may subscribe to the plan.

The new provisions also affect some 300,000 persons heretofore unable to obtain maternity benefits under U. M. S. These individuals, originally enrolled in Blue Cross, subsequently left their places of employment and continued their subscription on a nongroup basis. Under the U. M. S. family contract they may now obtain surgical indemnity in hospitals including maternity benefits.

Provision has also been made for minor surgical operations performed in a doctor's office.

More than 175,000 persons now subscribe to U. M. S., with approximately 10,000 physicians participating.

Woman's Auxiliary

West Virginia

The fall meeting of the executive board of the Woman's Auxiliary to the West Virginia State Medical Association was held at the Daniel Boone Hotel, Charleston. Among those who attended were the following officers and members of the advisory board: Mrs. Ulysses G. McClure, president, Charleston; Mrs. Delmas E. Greeneltch, president-elect, Wheeling; Mrs. Dana T. Moore, recording secretary, Parkersburg; Mrs. Ralph S. McLaughlin, corresponding secretary, Charleston; Mrs. Scott A. Ford, past president, Beckley; Mrs. A. G. Rutherford, first auxiliary president, Huntington, and Drs. Hu C. Myers, Philippi, John P. Helmick, Fairmont, Scott A. Ford, Beckley, and U. G. McClure, Charleston, members of the advisory board. Mrs. John P. Helmick, past president and now president of the Auxiliary to the Southern Medical Association, Fairmont, was also present.

The officers and members of the board were guests at a luncheon at which members of the Woman's Auxiliary to the Kanawha Medical Society were hostesses. Mrs. J. Preston Lilly, president of the Kanawha auxiliary, presided as chairman.

Guest speakers were Dr. Bert Bradford Jr., Charleston, who spoke on the work of the committee on relocation and reestablishment of returning medical veterans, of which he is a member, and Mr. Charles Lively, executive secretary of the state medical association, who discussed pending medical legislation.

The executive board of the Woman's Auxiliary to the State Medical Association has fixed May 13-15, 1946 as the time for the twenty-second annual meeting, which will be held at Huntington conjointly with the state medical association. The program for the annual meeting is in charge of the convention committee, of which Mrs. E. J. Humphrey, Huntington, is chairman.

Medical Legislation

STATE LEGISLATION

Kentucky

Bills Passed.—S. 87 passed the house March 21. It proposes that no person after July 1, 1946 shall maintain a hospital in the state without first obtaining a license therefor. The word "hospital" is defined as "any institution which maintains and operates organized facilities for the diagnosis, treatment and care of humans suffering from illness, injury or deformity, where bedside nursing care is rendered for a period exceeding twenty-four (24) hours, to care for ten (10) patients or more." S. 152 passed the house March 21. To amend the law relating to the practice of pharmacy, it proposes that any one who, while in the service of the armed forces, was regularly employed for a period not less than twelve months in the preparation and dispensing of drugs and medicines and who, in addition thereto, has successfully completed at least two years of study in a recognized college of pharmacy may apply for a pharmacist's license.

Bills Enacted.—H. 171 was approved March 23. It authorizes the establishment, maintenance and operation of medical service plan corporations. "Medical services" means the "general and usual services rendered and care administered by doctors of medicine." "Participating physician" means a "doctor of medicine licensed to practice medicine and surgery in this state under the provisions of the medical practice act" who agrees in writing to perform the services specified by the subscription certificates. S. 109 was approved March 23. To amend the law relating to the practice of chiropractic, it increases the required period of academic training and adds philosophy to the list of subjects which must be studied.

Massachusetts

Bills Introduced.—H. 820 proposes to authorize the department of mental health to construct and maintain an additional hospital for feebleminded children. H. 974 proposes that any veteran who had previous experience or qualifications in any trade or occupation licensed by the commonwealth shall be exempt from provisions of new laws enacted since the beginning of World War II. H. 1134, to amend the law relating to the offense of operating a motor vehicle while under the influence of intoxicating liquor, proposes that no person shall be adjudged guilty of such offense in the absence of testimony from a physician licensed to practice in this commonwealth to the effect that such person was under the influence of intoxicating liquor at the time of the alleged offense.

Bills Passed.—H. 298 passed the house March 25. To amend the law relating to the practice of pharmacy, it proposes to authorize the board and the commissioner of education to establish standards to be met by colleges of pharmacy, to grant certificates of approval to colleges meeting such standards and to revoke any certificate of approval previously issued to any college which lowers its standards below that established by the board and the commissioner. H. 1132 passed the house March 25. To amend the law relating to actions for personal injuries, it proposes that a physician or surgeon who makes a physical or mental examination of an injured person in connection with any claim for damages for personal injuries shall be deemed to be the agent of the party for whose information the examination was made for the purpose of answering interrogatories.

Bill Enacted.—H. 74 has become chapter 155 of the Laws of 1946. To amend the law relating to bacteriologic laboratories, it authorizes the department of public health to grant certificates of approval for laboratory tests on milk, foods, eating utensils, water and sewage in accordance with such rules and regulations as the department may establish.

Mississippi

Bills Passed.—H. 994 passed the senate March 25. It proposes an appropriation to be used and expended by the state board of health and the state department of education in cooperation with the international health division of the Rockefeller Foundation and the general education board, respectively, in carrying out a program of coordinated school, health and nutrition services. S. 221 passed the senate March 20. It proposes to require all teachers in the elementary and high schools of the state, and all other state employees who work directly with children, to submit annually to an examination for tuberculosis, including an x-ray analysis, by a competent physician or by the state health department.

Missouri

Bills Passed.—S. 424 passed the house March 28. It proposes to transfer to the State Board of Medical Examiners certain powers and duties heretofore vested in the State Board of Health. S. 432 passed the house March 26. It proposes the creation of a State Board of Chiropody and the assumption by such board of powers and duties heretofore vested in the State Board of Health. S. 433 passed the house March 26. It proposes to transfer to the State Board of Chiropody certain powers relating to licensure and registration of practitioners heretofore vested in the State Board of Health. S. 434 passed the house March 26. Relating to the licensing of midwives, it proposes to transfer to the division of registration and examination of the state department of education certain powers heretofore vested in the State Board of Health. S. 435 passed the house March 26. Relating to the licensing of chiropractors, it proposes to transfer to the executive secretary of the division of registration and examination of the state department of education certain powers heretofore vested in the State Board of Chiropractic.

Bills Enacted.—H. 280 was approved March 25. It authorizes a county or a group of counties to operate a health center. H. 754 was approved March 15. It authorizes any county to build and maintain a county hospital. H. 831 was approved March 15. To amend the law relating to the appointment of deputy state commissioners of health, it authorizes the county courts of any county to appoint as a deputy state commissioner of health a duly licensed qualified physician. The existing law requires only the appointment of a reputable physician.

New Jersey

Bills Introduced.—A. 47 proposes the establishment in the executive branch of the state government of a state department of health, the chief administrative officer of the department to be the state commissioner of health, who shall be a duly licensed physician, a graduate of a regularly chartered and legally constituted medical school, with at least five years' experience in the actual performance of public health duties, and with skill and experience in public health administration and sanitary science. He would receive an annual compensation of $15,000. S. 197, relating to coroners' and county physicians' reports, proposes that whenever an autopsy or chemical analysis is deemed necessary the county physician, or the coroner, shall cause a report of the findings of such autopsy, chemical analysis or other test to be filed with the county prosecutor's office, and such report shall be available for inspection to all officials, doctors or citizens having an established legitimate interest in the same.

Bills Passed.—S. 120 passed the senate March 19. It proposes the establishment of a diagnostic center to be fully equipped with all modern scientific equipment and provided with a staff of competent specialists in the field of medicine, psychiatry and psychology, to the end that full and complete diagnostic services shall be available to any governmental agency desiring to secure a complete diagnosis of any individual having need for such services. S. 278 passed the senate March 25. To amend the law relating to medical service corporations, it proposes, according to a statement attached to the bill, "to enable veterans with service connected disabilities to choose their own personal physician and to be treated in local hospitals that have been designated by the Veterans Administration."

New York

Bills Passed.—A. Res. 68 passed the assembly and the senate March 21. It proposes the creation of a joint legislative committee to make a survey and study of the socal, educational and physical problems of individuals afflicted with cerebral palsy, with special attention to those whose muscle involvement is commonly referred to as (1) spasticity or (2) athetosis or (3) ataxia and including those who have similar central motor or sensory defects. A. 2083 passed the senate March 25. It proposes to extend the life of the temporary state commission previously appointed to formulate a long-range health program from March 1946 to March 1947. A. 2274 passed the assembly March 21 and the senate March 22. To amend the public health law, it proposes provisions governing the furnishing of care and treatment to persons suffering from tuberculosis as well as diagnostic tests, studies and analyses for the discovery of tuberculosis, without cost or charge to any resident of the state who is suffering from, or is suspected of having, tuberculosis. A. 2582 passed the assembly March 21 and the senate March 25. To amend the education law, it proposes the granting of a license to practice physiotherapy without examination to persons showing a certificate of honorable discharge from the United States Army, Navy or Marine Corps and presenting to the department evidence that at the time of entrance into the military service he was a resident of the state and a graduate in good standing of a legally chartered school or college in the United States teaching physiotherapy, which school required a course of study equivalent to four years of seven months each. A. 2739 passed the senate March 25. It proposes to authorize the state department of taxation and finance to receive from the federal government any moneys which the federal government shall offer to the state to assist to inventory its hospitals, to survey the need for construction of hospitals, to develop a program for construction of public and other nonprofit hospitals and to construct such hospitals in accordance with such program, and generally for all of the purposes for which any such moneys shall be offered pursuant to any federal law. The term "hospitals" includes public health centers and related facilities. S. 1189 passed the assembly March 25. To amend the law relating to live pathogenic micro-organisms or viruses, it proposes that persons cultivating or possessing live pathogenic micro-organisms or viruses must satisfy the commissioner of health that such organisms or viruses will not become a menace to the public health and shall register with the commissioner of health. The registration must be renewed each year. S. 1319 passed the senate March 20 and the assembly March 21. To amend the law relating to hypnotic and somnifacient drugs, it would prohibit prescription therefor from being refilled if the prescription bears a direction to that effect. The proposal would further authorize the prescribers to indicate the number of times a prescription may be refilled. If the prescription is silent as to the refilling, then the prescription may be refilled by the pharmacist during a period of not more than six months from the original date of the prescription. A pharmacist would be prohibited from furnishing a copy of the prescription to the patient. S. 1354 passed the assembly March 25. To amend the law relating to nonprofit medical and hospital service corporations, it proposes to authorize the creation of dental expense indemnity service plans. Dental expense indemnity would consist of reimbursement for dental care provided through duly licensed dentists and for furnishing necessary appliances, drugs, medicines and supplies, prosthetic appliances, orthodontic appliances, precious metal and ceramic restorations. S. 1380 passed the senate March 25. To amend the law relating to divorce, it proposes to authorize reports of physicians to be received in evidence without the personal appearance of the physicians themselves, where insanity is in issue. S. 1563 passed the senate March 20 and the assembly March 25. It proposes the creation of a board of examiners in ophthalmic dispensing. S. 1695 passed the assembly March 20. To amend the education law, it proposes to redefine a podiatrist as one "who holds himself out as being able to diagnose, treat, operate or prescribe for any disease, pain, injury, deficiency, deformity or physical condition of the human feet, and who shall either offer or undertake by any means or method to diagnose, treat, operate or prescribe for any disease, pain, injury, deficiency, deformity or physical condition of the same within the following limitations: operations on the feet shall be limited to minor surgery; and the use of anesthesia shall be limited to local anesthetics." S. 1797 passed the assembly March 21. To amend the workmen's compensation law, it proposes that physician members of the industrial council shall not be eligible for authorization to render medical care under the act and shall not examine, treat, consult or in any other way care for a compensation claimant either at the request of such claimant or of a carrier. S. 2392 passed the senate March 22. It proposes to authorize the state department of taxation and finance to receive from the federal government any moneys which the federal government shall offer to the state to assist to inventory its hospitals, to survey the need for construction of hospitals, to develop a program for construction of public and other nonprofit hospitals and to construct such hospitals in accordance with such program. Hospitals would include public health centers and related facilities.

Rhode Island

Bills Introduced.—H. 960 proposes to extend to March 29, 1946 the life of the special committee studying problems arising out of the Rhode Island Cash Sickness Compensation Act. S. 224 proposes the creation of a state board of examiners in naturopathy. According to the proposal, "Naturopathy . . . is a distinct system of healing based upon its own teachings as to cause of disease, the prevention and cure of human illness and the maintenance of health. It uses no drugs or medicines. It is the science of prevention, diagnosis and treatment of disease by means of any one or more of the psychological, physical and material forces or agencies of nature. Its philosophy embraces the triplicity of sciences: The psychological: such as psychotherapy. The physical or mechanical: such as manual or mechanical manipulation, exercise, hydrotherapy, heat, light, pneumatics and electrical and mechanical devices. The material: (Phytotherapy) such as corrective nutritional and dietetic regimens, concentrated supplemental food substances and fasting as correctives in the treatment of disease and maintenance of health." Licentiates would not be authorized to write prescriptions for drugs or internal medication or practice major surgery.

South Carolina

Bill Passed.—H. 1157 passed the house March 22. It proposes that no person or combination of persons shall practice or attempt to practice as a dental laboratory technician without a certificate or registration either as a registered apprentice or as a registered dental laboratory technician issued pursuant to the provisions of this act by the state board of dental examiners. The practice of a dental laboratory technician is described as "the fabrication of prosthetic dental appliances, such as the using of gold, other metals or combination of metals, plastics, porcelains, artificial teeth or other materials in the manufacture of appliances worn in the oral cavity, replacing teeth and tissue or worn on or around the teeth." S. 101 passed the house March 22. It proposes to require every physician attending a pregnant woman for a condition relating to pregnancy to take or cause to be taken a sample of her blood at the time of the first examination and to submit that sample to an approved laboratory for a standard serologic test for syphilis.

Bill Enacted.—H. 566 has become Governor's Act No. 546 of the Acts of 1946. It amends the definition of the practice of optometry by including therein one who practices orthoptics or who prescribes or fits contact lenses.

Virginia

Bills Enacted.—H. 257 has become chapter 295 of the Laws of 1946. It provides that any person who has tuberculosis in a communicable form who, having been instructed in writing by the local board of health, department of health or health officer or superintendent of any sanatorium of the state to take precautions to protect the members of his household and the public from being infected by tuberculosis communicated by such person, wilfully refuses to follow such instructions shall be guilty of a misdemeanor. S. 21 has become chapter 197 of the Laws of 1946. It authorizes the state board of health to initiate and administer a program of hospital and outpatient treatment and care for indigent and medically indigent persons residing in the state. S. 149 has become chapter 186 of the Laws of 1946. It authorizes the creation of city hospital authorities to investigate hospital, medical and health conditions and to carry out hospital projects so as to provide adequate hospital, medical and nursing facilities. S. 237 has become chapter 280 of the Laws of 1946. It provides for the creation of an examining board for the certification of clinical psychologists.

West Virginia

Bill Enacted—S 3-X was approved March 28 It provides a new law for the organization and regulation of hospital service and medical service corporations Among other features, it creates a hospital and medical service advisory council to assist the insurance commissioner in the supervision of such corporations "Medical service" is defined as "such medical and surgical care, to be provided by duly licensed physicians, or such payment therefor, as may be specified in the contract made by the subscriber with the corporation"

Washington Letter

(From a Special Correspondent)

April 1, 1946

Veterans to Get Three Way Hospitalization Program

Gen Omar N. Bradley, Veterans Administrator, has announced a three way hospitalization program for his agency which he says will give ex-servicemen and women medical care "second to none" The three points are (1) immediate construction of new hospitals to cost $448,000,000, eighty in all, with additions to present hospitals, (2) a drive to staff Veterans Administration hospitals with the best doctors in the country and (3) an arrangement with state medical groups to give veterans with service connected disabilities treatment in their own home towns by their own private doctors and hospitals Dr (formerly Major General) Paul R Hawley, chief of the Veterans Administration new Department of Medicine and Surgery, already has some of the plans in operation on behalf of war veterans Congress has authorized the $448,000,000 for hospitals but has appropriated only $300,000,000 The agency is confident that the remaining $148,000,000 will be forthcoming The agency is at present seeking four hundred physicians to fill vacancies as rating specialists in regional offices Veterans are to be given preference in appointments as consulting specialists for veterans' hospitals

Military Training Legislation Being Shelved

House Military Committee members predict that there will be no universal military training legislation this year It is planned to submit the controversial subject to the new Congress when it convenes next January The fact that this is an election year is a determining fact Furthermore the Army has stated that it does not want selective service and universal training at the same time, and it is now asking for an extension of the wartime draft The Senate Military Affairs Committee has set April 9 as a deadline for a vote on draft extension

Proposal for Cancer Research Center

The National Advisory Cancer Council has asked for construction of a cancer research hospital at Bethesda, Md, adjacent to Washington, as part of the national campaign to combat the disease Eric Johnston, president of the United States Chamber of Commerce, opening cancer control month, asked for a nationwide education campaign The Advisory Cancer Council has urged Surg Gen Thomas Parran to ask Congress for funds to build a cancer hospital adjacent to the National Cancer Institute

Reduction in Fatality Rate of Meningitis

Dr James G Cummings, head of the District of Columbia Health Department Bureau of Preventable Diseases, pointed to the possibility of meningitis becoming a rare disease when he called attention to the drop in the fatality rate from 40 to 10 per cent in the last ten years He gave credit to use of sulfonamide drugs and penicillin and said that continued efforts in early diagnosis and treatment would reduce deaths still further

Many Physicians Still in Army and Navy

Despite discharges, more than two thirds of the total of 845 practicing physicians, hospital residents and interns of Washington who joined the armed services are still in uniform a poll shows And of the total of 262 who have returned, only a small number have been able to find office space either to resume or to begin practice One physician said that many doctors are literally practicing out of their hats"

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

CALIFORNIA

Popular Medical Lectures.—The sixty-fourth course of popular medical lectures sponsored by Stanford University School of Medicine, San Francisco, consisted of the following:

March 1, Poliomyelitis, Dr. Harold K. Faber, How It Starts, Dr. William H. Northway, Its Early Treatment and Dr. Donald E. King, Its Late Treatment, all of San Francisco.

March 15, Dr. Emile F. Holman, San Francisco, Surgery of the Heart.

March 29, Dr. Russell Van Arsdale Lee, Palo Alto, The Conquest of Communicable Disease.

April 12, Dr. Robert S. Stone, San Francisco, Atomic Energy and Medicine.

Lectures for Prospective Members.—The Los Angeles County Medical Association has recently introduced a series of six lectures for applicants to membership in the association. Two lectures are to be given each month and must be attended by the applicant before his application will be considered by the council. The subjects of the lectures are medical organization, health insurance, medical public relations, medical ethics, medical education and medical economics, and medical malpractice. The first lecture, January 25, was attended by more than 200 applicants, while the five lectures held up to March 21 had been presented to audiences of 200 and more applicants. Because of previous commitments, illness or for other reasons considered adequate, applicants who have been unable to attend any one or all of the lectures given on the third and fourth Fridays of each month will be given the opportunity of making up lectures especially presented for them on Sunday afternoons. The dates for the Sunday lectures have not been set but are to be determined when the need for them arises. All applicants who have failed to attend any of the regular series are requested to notify the secretary's office and will in turn be informed as to the time of the make-up lecture. When a group of applicants has attended the six lectures, they will be interviewed in smaller groups by members of the subcommittees, following which the committee on admissions will report to the council on these applicants for membership. According to the *Bulletin* of the association this indoctrination program was presented to the council of the California Medical Association and approved with the recommendation that similar programs be instituted by other county medical associations in the state.

FLORIDA

Personal.—Dr. Erwin F. Hoffman, Jacksonville, recently resigned as epidemiologist with the state board of health and has accepted the position of director of the Central Florida Health District, with headquarters at Ocala. Dr. Hoffman will also direct the Northern Florida and Southwestern Florida Health Districts until officers have been secured for these.——Dr. George E. Lacy, Chattanooga, Tenn., has been appointed director of venereal disease control for Miami and Dade County, effective February 8.

GEORGIA

Physician Honored.—Dr. Simeon E. Sanchez, Barwick, has been selected to receive the 1945 Kiwanis award for outstanding and unselfish service to the community. Dr. Sanchez is the "man of the year" in Brooks County. The award is a plaque of bronze. Dr. Sanchez graduated at Atlanta College of Physicians and Surgeons in 1901.

Appointments at Emory.—Dr. Daniel C. Elkin has returned to his position as the Joseph B. Whitehead professor of surgery at Emory University School of Medicine, Atlanta. Dr. Elkin has been in military service. New appointments to the faculty include Drs. Frank L. Engel, New Haven, Conn., associate professor of medicine; Max Michael Jr., Athens, assistant professor of medicine; Harry L. Allen Jr., Fort Myers, Fla., assistant professor of anatomy; Albert L. Evans, Sandersville, William P. Leonard Jr., Atlanta, and Virgin D. Shepard, Rochester, Minn., all assistant professors in the department of surgery; James T. King, Quitman, and Buford L. O'Neal, Shreveport, La., assistant professors in clinical otorhinolaryngology.

ILLINOIS

Examination to Fill Position of Health Officer.—The state department of public health announces a competitive examination to fill the position of health officer of the East Side Health District, East St. Louis, to be held in Chicago on April 13. Admission to the examination will be limited to persons possessing minimum qualifications of education and experience. Further information may be obtained by writing to Dr. Roland R. Cross, director of the Illinois Department of Public Health, Springfield.

Chicago

Cardinal Stritch Aids Loyola.—Samuel Cardinal Stritch, Archbishop of Chicago, has promised to provide $50,000 a year to aid Loyola University School of Medicine if the Alumni Association will raise an annual sustaining fund of a similar amount. The Archbishop's support is to continue until the endowment fund has reached its goal and is able to maintain the school.

Dr. Slight to Direct Rehabilitation.—Dr. David Slight, Chicago, has been appointed acting superintendent of a new state division of veterans' rehabilitation centers, it was announced February 28. Dr. Slight, who will resign June 30 as professor and head of the department of psychiatry, University of Chicago School of Medicine, where he is now on sabbatical leave, will direct a statewide system of rehabilitation centers planned under the new division, which will be a part of the public welfare department.

Gift to Gifford Memorial Fund.—The department of ophthalmology, Northwestern University Medical School, has received an additional gift of $4,000 to the Sanford R. Gifford Memorial Fund from Mr. Bernard Spero, president of the House of Vision. Mr. Spero had made an earlier donation of $1,000. It is proposed to use this sum to establish a fellowship in research and teaching of refraction and allied subjects to young ophthalmologists. The memorial fund was established in 1944 by friends and associates of Dr. Sanford R. Gifford shortly after his death.

Student Receives Borden Award.—Dr. Richard S. Farr, Highland Park, Mich., has been granted the $500 Borden Undergraduate Research Award at the University of Chicago School of Medicine. Dr. Farr graduated at the medical school March 22 and was granted the award for his paper on experiments on the fate of the transfused leukocyte. A lieutenant (jg) in the U. S. Navy Medical Corps, Dr. Farr will take a naval internship. The award is one of a group that were established in various medical schools (THE JOURNAL, Dec. 22, 1945, p. 1218).

KANSAS

Changes in Health Personnel.—Dr. Thomas R. Hood, Lawrence, has been assigned as full time health officer of Cowley County, with headquarters in Winfield. Dr. H. Dale Palmer is acting director of the Sedgwick County unit during the absence of Dr. John W. Turner, Marion, who is taking graduate work in public health at the University of Michigan Medical School, Ann Arbor.——Dr. Charles M. Fitzpatrick, Salina, has been named Saline County health officer, succeeding Dr. George Seitz.

MASSACHUSETTS

Dwight O'Hara Named Dean of Tufts.—Dr. Dwight O'Hara, Waltham, president-elect of the Massachusetts Medical Society and professor of preventive medicine, Tufts College Medical School, Boston, has been made dean of the medical school. He has been acting dean for the past four years while Dr. Albert W. Stearns was on leave to the Navy Medical Corps. Dr. Stearns recently became head of the new department of applied sociology in the Tufts School of Liberal Arts, according to the New York *Times*. Dr. O'Hara graduated at Harvard Medical School, Boston, in 1919.

Licensing of Osteopathic Physicians.—The Massachusetts Approving Authority recently approved the Kirksville College of Osteopathy and Surgery, Kirksville, Mo., and the Philadelphia College of Osteopathy and Surgery, Philadelphia. Both schools are approved by the American Osteopathic Association. The approval of the Massachusetts Approving Authority followed hearings at which representatives of both schools presented all the facts concerning the qualifications demanded by the approving authority for medical schools. The approving authority had previously denied approval to the Des Moines Still College of Osteopathy, Des Moines, Iowa, which is a school approved by the American Osteopathic Association, an action indicating that the approving authority has not been giving blanket approval to all schools approved by the American Osteopathic Association. As a result of these changes in the law controlling the practice of medicine in the commonwealth and the action of the approving authority, all applicants for examination for registration who matriculated on or after Jan. 1, 1941 must be graduates of medical schools or osteopathic schools that have been judged worthy of approval. According to the *New England Journal of Medicine*, from 1909 until the middle of 1944 graduates of any medical school, osteopathic or regular, were eligible to take the examination of the Massachusetts Board of Registration in Medicine, irrespective of the quality of the school from which they had graduated. But in 1936 the so-called "Approving Authority Law" was passed, which stated that students who matriculated at a medical school on or after Jan. 1, 1939 must have graduated from a school approved by the approving authority. The effective date was subsequently changed to Jan. 1, 1941. This act also specified that, for the purposes of the approving authority, schools approved by the American Osteopathic Association and schools approved by the American Medical Association would receive the same consideration. At the last session of the legislature, apparently, the *New England Journal of Medicine* stated, because they feared that the approving authority never would approve osteopathic schools, the osteopaths introduced legislation to set up an osteopathic board of registration, but the bill was withdrawn. Finally, at the suggestion of the Committee on Education of the legislature, a compromise bill was drawn and finally passed. The bill states that the approving authority shall be increased from three to five members, one member being the osteopathic member of the board of registration in medicine, who shall be a graduate of a school approved by the American Osteopathic Association and by the approving authority, and the other a layman.

MICHIGAN

New Director of Health Service.—Dr. John K. Altland, Hastings, director of the Barry County Health Department for more than five years, has resigned, effective April 1, to become director of the bureau of local health service of the Michigan Department of Health. Dr. Altland fills the position that was vacant when Dr. Eldred V. Thiehoff, Lansing, resigned to become health commissioner of Peoria, Ill. (THE JOURNAL, March 16, p. 725).

Personal.—Dr. Edwin D. MacKinnon, Saginaw, and Dr. Louis J. Gariepy, Detroit, were on February 27 appointed members of the Michigan State Board of Registration in Medicine, succeeding Drs. Eugene S. Thornton, Muskegon, and Harold L. Morris, Detroit.——Dr. George D. Woodward has resigned, effective March 15, as superintendent of the Sault Ste. Marie State Hospital, Sault Ste. Marie. Dr. Thomas W. Thompson, Traverse City, assistant superintendent of the Traverse City State Hospital, will be acting superintendent at Sault Ste. Marie.

Physician Honored.—Dr. Mary Margaret Frazer, Detroit, was chosen "The Woman of the Year of 1945" by the Soroptimist Club, a group of professional business women in Detroit. Dr. Frazer was selected for her work in organizing and serving as medical director of a cancer detection clinic in the city. Each year the club honors the "woman who has made the greatest and most important contribution to the economic advancement of women in Metropolitan Detroit." The cancer clinic, organized by Dr. Frazer, is for women only and is sponsored by the Detroit Federation of Women's Clubs.

Quarantine Regulations Amended.—Quarantine regulations were removed from five communicable diseases by unanimous vote of the Michigan State Council of Health on March 13. If the patient is isolated no quarantine will be enforced on members of the household for scarlet fever, meningococcic meningitis, poliomyelitis, measles and chickenpox. This change in Michigan's regulations for the control of communicable diseases goes into immediate effect. Quarantine will be required only for smallpox and diphtheria. The council also included streptococcic infections of the nose or throat under the regulations governing scarlet fever.

MISSOURI

Lecture Honors George Dock.—The St. Louis Society of Internal Medicine offered a special program March 19 to honor Dr. George Dock, Altadena, Calif., who during his career has been professor and head of the department of internal medicine at the Universities of Michigan, Tulane and Washington and professor of pathology at the University of Texas. The event featured a lecture by Dr. Thomas Francis Jr., professor and chairman of the department of epidemiology, University of Michigan School of Public Health, Ann Arbor, on "Influenza: Its Distribution and Control." The weekly *Bulletin* of the St. Louis Medical Society states that Dr. Dock, while at Washington University, not only left his mark as a teacher but aided in no small degree the development of the medical library of the university and the St. Louis Medical Society.

NEW JERSEY

Dinner for Harrison Martland—Annual Lecture.—On April 10 Dr. Harrison S. Martland, since 1925 medical examiner of Essex County, will be honored at a dinner given by the Essex County Pathological and Anatomical Society. The event will precede the Harrison S. Martland Lecture to be given by Selman A. Waksman, Ph.D., New Jersey Agricultural Experiment Station, Rutgers University, New Brunswick, on "Antibiotics, with Special Reference to Streptomycin." The lecture was established in 1935 by the Essex County Pathological and Anatomical Society, of which Dr. Martland is a past president. He is also professor of forensic medicine at the New York University College of Medicine, New York, director of the Graduate Fortnight of the New York Academy of Medicine and an associate editor of the *American Journal of Surgery*.

NEW YORK

Executive Director Chosen for Hospital Council.—Dr. Albert D. Kaiser, health officer of Rochester, has been named executive director of the newly created Council of Rochester Regional Hospitals which was established in a five year agreement with the Commonwealth Fund (THE JOURNAL, March 23, p. 804). Dr. Kaiser will continue his position as health officer but will immediately take over the direction of the experimental regional hospital and medical project. Dr. Paul A. Lembcke, Rochester, formerly state district health officer in Rochester, will serve as medical associate, effective April 1. Charles M. Royle has been named business manager but will continue in his position as executive manager of the Rochester Hospital Council.

Expanded Program in Optics.—Gifts totaling $150,000 from the Eastman Kodak Company and the Bausch and Lomb Optical Company will support new developments in teaching and research at the Institute of Optics, University of Rochester, it was announced March 15. A part of the program includes the appointment of Brian O'Brien, Ph.D., to the newly created post of research professor of physics and optics, the first research professorship at the university. The enlarged program of the Institute of Optics is in addition to the plans for expanding the department of physics, announced March 14, for which $550,000 has been appropriated by the university for additions to building and equipment for the department. The two programs in physics and optics will be coordinated under the administrative direction of Lee A. DuBridge, Ph.D., professor and chairman of the physics department. Dr. O'Brien, who has been director of the institute since 1938, will devote most of his time to important research projects. He joined the university staff in 1930 as professor of physiologic optics. The new funds for the Institute of Optics were given by the Eastman Kodak Company under a 1945 contribution of $100,000 and by the Bausch and Lomb Optical Company, which is providing $50,000. Both companies assisted in founding the institute in 1929 with financial support and technical assistance. In 1934 the university assumed entire financial responsibility, but Eastman Kodak and Bausch and Lomb continued their interest by having representatives on the board of advisers. The institute is said to be the only one of its kind in this country and one of the few in the world offering work in optics which approaches in scope and completeness that given at the university.

New York City

University News.—The Association of the Alumni, Columbia University College of Physicians and Surgeons, elected Dr. Bernard S. Oppenheimer president during its annual meeting in New York, March 2. Dr. Charles C. Lieb was named secretary. Major Gen. William J. Donovan and Dr. Willard C. Rappleye, dean of the medical school, spoke at the dinner, at which Dr. John J. H. Keating, outgoing president of the association, was toastmaster.

Personal.—Dr. Emery A. Rovenstine, professor of anesthesia at New York University College of Medicine, will, through the devotion of former Bellevue Hospital residents who have served under him, have his name permanently inscribed on a seat in Alumni Hall, the auditorium of the university's proposed new medical center. A committee of former residents, headed by Dr. Solomon G. Hershey, collected $1,100 for the Alumni Hall Fund in honor of Dr. Rovenstine.——Dr. Robert R. Cadmus, recently released from service in the army, has been named director of the Vanderbilt Clinic.

Residencies and Fellowships in Physical Medicine.—Columbia University College of Physicians and Surgeons announced that the first group of residents to be appointed in its program of teaching and research in physical medicine will not be assembled for the introductory course until about May or June. The announcement describing the program appeared in THE JOURNAL March 2, page 591, and indicated that first appointments would be made by March 1. The recent announcement from the university indicates that there are still vacancies in the residencies in physical medicine at some of the hospitals cooperating in the program and that the introductory course will be given as soon as men with proper qualifications are assembled. Applications are also being considered for the following year.

Grants to Long Island College.—Gifts and grants totaling $143,437 were made to the Long Island College of Medicine, Brooklyn, during the year ended January 1, exceeding by $16,063 contributions received during the previous year. These contributions, not including increments in the endowment of the college, fall into six categories: general, $84,066; memorials and scholarships, $2,503; teaching, $21,904; research, $23,173; fellowships, $2,000, and prizes, $75. The development fund, from which a total of $63,662 was utilized during the calendar year 1945, represents the largest amount received. The Commonwealth Fund gave the second largest amount. It contributed $20,304 to the department of psychiatry. To establish this department the Commonwealth Fund made a six year grant, which started in 1943 with a contribution of $5,112. This department, named after the late Dr. William Alanson White, graduate of the college in the class of 1891, is now located in a new building at 88 Amity Street.

OHIO

Special Program for Child Health Day.—The Academy of Medicine of Cleveland, Western Reserve University School of Medicine, Cleveland, and the division of health of Cleveland are cooperating in a refresher course in obstetrics and pediatrics at the Cleveland Academy of Medicine, April 29-May 1, in observance of National Child Health Day. Additional information can be obtained from Dr. Arthur W. Thomas, Room 27, City Hall, Cleveland 14.

Penicillin and Tooth Decay.—About 1,000 boys in a large industrial school in the East will be the subjects of an experiment by Thomas J. Hill, D.D.S., professor of clinical oral pathology, Western Reserve University School of Medicine, Cleveland, to test the use of penicillin as a means of eradicating tooth decay. Dr. Hill will conduct the work for a year or more, starting about July 1. The selected group have been the subjects in short surveys at Western Reserve. This experiment included the mixture of penicillin wtih tooth powder.

Postgraduate Assembly.—The eighteenth postgraduate assembly of the Mahoning County Medical Society will be conducted at the Pick-Ohio Hotel in Youngstown, April 17, by the following members of the staff of Johns Hopkins University School of Medicine, Baltimore:

Dr. William F. Reinhoff Jr., *associate professor of surgery.*
Dr. Charles W. Wainwright, associate in medicine.
Dr. Leroy M. Polvogt, associate *professor* of laryngology and otology.
Dr. Raymond E. Lenhart, associate in *orthopedic surgery.*
Dr. Houston S. Everett, associate *professor* of gynecology.

TENNESSEE

State Medical Meeting.—The Tennessee State Medical Association will hold its 1946 session at the Hotel Andrew Johnson, Knoxville, April 9-11, under the presidency of Dr. William C. Chaney, Memphis. Among the out of state speakers will be:

Dr. Robert A. Arens, Chicago, Radiologic Survey of the Urinary Tract—Excretion *Urography.*
Dr. Hughes Kennedy, Jr., Birmingham, Ala., Obstetric and Pediatric Meddling.
Dr. W. W. Bauer, Chicago, Health Education Today and Tomorrow.
Mr. James Stegen, Chicago, Showdown on Political Medicine.
Mr. George Bugbee, Chicago, Benefits of the Hill-Burton Bill, S. 191.
Dr. Roger I. Lee, Boston, President, American Medical Association, The American Medical Association—What, Who and Why.

The woman's auxiliary to the association and the Texas State Pediatric Society will also meet.

VIRGINIA

Changes in Health Personnel.—Dr. William Grossmann, Richmond, director of the bureau of communicable diseases of the Virginia State Department of Health, has resigned, effective April 1, to take a postgraduate course in medicine at the University of Virginia Department of Medicine, Charlottesville. Dr. Harry H. Henderson, Richmond, assistant epidemiologist, has resigned, effective April 1, to take a postgraduate course in medicine at the Medical College of Virginia, Richmond. Dr. Edward M. Holmes Jr., Richmond, resumed his position as director of the division of venereal diseases, effective March 15. He recently was released from the army.

John Huff Named to New Position.—Dr. John M. Huff, U. S. Navy, retired, on March 7 was appointed superintendent of public health of Norfolk in a newly created separate department of public health which was set up, effective March 15. The city's bureau of public health was a part of the department of public welfare but became the department of public health March 15 as the result of an ordinance adopted by the city council. Dr. Albert L. Chapman, U. S. Public Health Service, has been acting commissioner of health of Norfolk, following the resignation of Dr. John C. Sleet, who retired December 31.

Stuart McGuire Lectures and Graduate Clinic.—The Stuart McGuire Lecture series and the Spring Postgraduate Clinic of the Medical College of Virginia, Richmond, were presented in cooperation with the department of clinical education, Medical Society of Virginia, March 7-8. Dr. Elmer L. Sevringhaus, Nutley, N. J., gave both lectures, on the clinical endocrinology of the female and male sex hormones. A symposium on chemotherapy and antibiotics was the theme of the graduate program with the following speakers:

Dr. Harrison F. Flippin, Philadelphia, Cardinal Principles of Sulfonamide and Antibiotic Therapy.
Dr. Harvey B. Haag, Richmond, Va., Absorption of Sulfonamides from Local Application.
Dr. Isaac A. Bigger, Richmond, Clinical Experience with Local Use of Sulfonamides.

State Society Appoints Public Relations Director.—Mr. Henry S. Johnson, Hylas, has been appointed director of public relations of the Medical Society of Virginia, effective March 15, with offices at the headquarters of the society, Richmond. Mr. Johnson will contact the physicians of the state, giving them information as to medical, surgical and hospital service plans and aiding in the development and establishment of such plans. In addition he will inform the public as to the benefits of such plans and services. A broad constructive program for medical care has been instituted. Mr. Johnson will be available not only to the local medical societies throughout the state but to local civic groups and organizations for discussion of plans to inaugurate services and to assist in the development of such plans as will provide expansion of medical services. Mr. Johnson once served as supervisor of vocational rehabilitation of the Virginia State Department of Education and during 1944-1945 was state representative of the National Foundation for Infantile Paralysis.

WASHINGTON

Smallpox Outbreak—Five Deaths.—On March 29 five deaths had occurred in an outbreak of smallpox in Seattle. Newspapers reported that the infection came from Japan. The army placed a strict smallpox quarantine on the 2,508 soldiers and crew members of the army transport *Marine Devil* March 31 when it arrived in San Francisco from Korea with 2 cases of the infectious disease aboard. Port of embarkation officials said that all precautions were being taken "for the protection of the public" to prevent possible further spread of the oriental black smallpox epidemic which has theatened the entire Pacific Coast. The disease was believed brought to this country by servicemen returning from the Pacific. The *Marine Devil* was detained at a special anchorage in San Francisco Bay, where passengers, mostly soldiers returning for discharge, will be held under quarantine until April 7. The navy transport *LaSalle*, carrying 1,400 service men, is quarantined at San Francisco after bringing a smallpox case from the Pacific, it was said. On April 1 the fire stations in Seattle were to be manned with doctors and attendants in an effort to vaccinate 50,000 persons daily; 15,000 persons were being vaccinated each day at the time of this report. Canada has barred all persons traveling from Seattle to Victoria, B. C., by boat who are unable to show a vaccination certificate. In San Francisco at least half the population has been vaccinated, it was stated.

WEST VIRGINIA

State Society Activities.—Dr. Alonzo R. Sidell, Williamstown, has been appointed a member of the council of the West Virginia State Medical Association to succeed Dr. Curtis P. Artz, Grantsville, who resigned when he accepted a three year residency in surgery at Ohio State University Hospital, Columbus. The following doctors have been elected by the council of the association as honorary life members: Benjamin M. Stout, Morgantown; William M. Riley, Lillybrook; Robert Wriston, Beckley; Ralph C. Mitchell, Sabine, and Lonzo E. Steele, Logan. At a meeting held at Parkersburg late in February the council unanimously adopted a resolution calling on the Public Health Council to waive the requirement of an academic degree by applicants for licensure by reciprocity who served *in the armed forces during* World War II The regulations now require that such applicants must have completed two years of academic work of collegiate grade in a standard college of arts and sciences of equal rank with the college of arts and sciences at West Virginia University

GENERAL

New Head of Oxford Press Medical Department.—Russell I Garton has been named to succeed Frederick F. Randolph as head of the medical department of Oxford University Press, New York and London, effective April 1

Pan American Congress of Pediatrics—The first Pan American Congress of Pediatrics is now being planned for New York City late in 1948 Dr Jay I Durand, Seattle, is chairman of the organization committee and Dr Felix A Hurtado Galtes, Havana, Cuba, associate chairman

Examinations for Fellowship for College of Chest Physicians—The next oral and written examinations for fellowship in the American College of Chest Physicians will be held at San Francisco on June 29 Applicants should communicate with the Executive Secretary, American College of Chest Physicians, 500 North Dearborn Street, Chicago 10

Personal—Dr Ashley W Oughterson of the Army Institute of Pathology, Washington, has been named executive vice president of the American Cancer Society Colonel Oughterson, recently medical aide to General Douglas MacArthur and formerly clinical professor of surgery at Yale University School of Medicine, New Haven, Conn, will serve as medical and scientific director in his new post

Credentials Lost.—Dr Horace P Stimson, Chicago, announced the loss of his diploma from Harvard Medical School, *Boston*, dated *June 22, 1922*, also his diploma from Amherst *College dated June 5, 1918*, his medical license of 1924 from the state of Maine and his license of 1926 from the state of Florida Dr Stimson reports that the loss occurred in the course of moving and storage in the past four years while he was on active duty in the medical corps of the U S Naval Reserve

New Officers of National Health Council—Mr Philip R Mather, Boston, was elected president of the National Health Council at its meeting March 22 at the Hotel Commodore, New York Ira V Hiscock, Sc D New Haven, was named vice president and Dr Reginald M Atwater, New York, secretary Louis I Dublin, Ph D New York, has been elected chairman of the citizens planning committee of the National Health Council Mr Albert Lasker vice chairman and Dr. Howard A Rusk, New York, secretary

International College of Surgeons—The International College of Surgeons, United States Chapter, will hold its eleventh assembly and convocation in Detroit October 21-23 Surgical clinics in Detroit hospitals will feature the first morning of the assembly Thereafter all the meetings the convocation and the exhibition will be held in the Masonic Temple The Detroit Statler and the Book-Cadillac will be hotel headquarters Additional information may be obtained from Dr. Louis J Gariepy, executive secretary, 16401 Grand River Avenue, Detroit

Surgeons Plan Clinical Congress—The American College of Surgeons will hold its thirty-second clinical congress at the Waldorf-Astoria, New York, September 9 13, the first congress since the meeting in *Boston* in 1941 Since the last session 2,744 surgeons have been received into fellowship in absentia Officers, regents and governors have remained in office since 1941 because of the cancellation of annual meetings of the fellows Special interest will also therefore be attached to the installation of the officers elect, headed by Dr Irvin Abell, Louisville, Ky, chairman of the board of regents as president. Dr William Edward Gallie Toronto, who has been president since November 1941 will give the address at the presidential meeting and convocation on the evening of September 9 in the Grand Ballroom of the Waldorf-Astoria The address of the American College of Surgeons is 40 East Erie Street, Chicago 11

Francis Dieuaide Named Scientific Director of the Insurance Research Fund—Dr Francis R Dieuaide recently chief of the tropical disease treatment branch of the Surgeon General's Office of the army, has been named scientific director of the Life Insurance Medical Research Fund, it was announced March 28 Dr Dieuaide who received the Legion of Merit for his supervision of the treatment of malaria and other tropical diseases in the army, is now on terminal leave with the rank of colonel He assumed his duties with the Life Insurance Fund on April 1 Before going into the medical corps in 1943 Dr Dieuaide was clinical professor of medicine at Harvard Medical School, Boston a post which he is resigning The Life Insurance Medical Research Fund was established last year to make grants to universities and medical schools for research on diseases of the heart and related diseases The fund plans to make grants of more than $3,000,000 for this purpose over the next five years A total of 147 life insurance companies in this country and Canada are supporting the fund (The Journal, January 12, p 100) Coincident with the announcement of Dr Dieuaide's appointment Mr Albert Linton, chairman of the fund, announced that directors of the fund had approved a new series of grants totaling $310 000 in support of research work on diseases of the heart and related diseases at twenty-seven institutions in this country and in Canada. This action brings the total of grants made since the fund was organized to $436 000 Other applications are still under consideration As scientific director, Dr Dieuaide will investigate the applications for funds and make recommendations to the group's advisory council The new grants made by the fund represent a total of thirty-four specific allocations to institutions and research workers Five of the grants are for studies on arteriosclerosis and coronary disease, four for studies on hypertension, three for studies on kidney diseases and five for research on rheumatic fever Nine of the studies are concerned with fundamental physiologic problems, and eight are for basic chemical and pharmacologic studies of the circulation Dr Dieuaide graduated at Johns Hopkins University School of Medicine, Baltimore, in 1920 He specialized in internal medicine and heart disease at Johns Hopkins and abroad and was an associate in medicine at Johns Hopkins until 1924 For the ensuing fifteen years Dr Dieuaide was with the Peiping Union Medical College, an institution founded and supported by the Rockefeller Foundation at Peiping, China, as professor and head of the department of medicine He joined the faculty of Harvard Medical School, Boston, on his return to this country in 1939

LATIN AMERICA

Health Activities in Latin America—*Congress of Neurosurgery*—The second South American Congress of Neurosurgery will be held in Santiago, Chile, in April 1947 The program will be divided into three discussions, hydrocephalus, histology in brain tumors in relation to clinical findings, and brain abscess Dr Alfonso Asenjo is secretary

Laboratory Physicians Form Society—The Cuban Society of Clinical Laboratory Physicians was formed recently with the following officers among others Dr Antonio Selleck Azzi, president, Dr Emilio Garcia Perez, vice president, Dr Luis Torra Cabarroca, secretary, Dr Emilio Umanue Perez, treasurer

Personal—Dr Ernest B Howard Boston, former director of the division of venereal disease control of the Massachusetts Department of Public Health, has taken up duties as chief of the Institute of Inter-American Affairs health and sanitation field party in Peru——Dr Robert M Mein Wichita Falls, Texas, recently relieved from active duty by the War Department was to leave the United States in late January or early February for Brazil Dr Mein will serve as medical officer in Belem Brazil, succeeding Major Hyman Zukerman, who recently returned to the United States for discharge from the army Dr Mein's family will accompany him——Dr Paul H. Harmon Huntington, W Va, addressed the Colegio Medico de El Salvador, March 20 21 Dr Thomas D Masters, Springfield Ill, also spoke, on "Water Balance"

Rabies Epidemic in Ecuador—The Ecuadorean government has launched an extensive campaign against rabies, a press report indicates Dr Gonzalo Cardenas is in charge of the work It is reported that more than 16 000 dogs in Quito alone have been killed while throughout the republic at least 40 000 dogs have been killed The press report stated that while dogs and sheep are dying in large numbers only 400 human beings were known to have died of rabies at the time the physician was interviewed

CORRECTION

New Absorbable Surgical Dressing—The third reference accompanying the current comment with this title in The Journal February 16 page 414, was incorrectly given and should have been Frantz, Virginia Kneeland and Lattes, Raffaele Oxidized Cellulose—Absorbable Gauze, J A M A **129:798** (Nov 17) 1945

Deaths

Fred M. Smith ⊕ noted internist of Iowa City, died February 23, aged 57, of coronary occlusion.

Dr. Smith was born in Yale, Ill., May 29, 1888. He received his B.S. at the University of Chicago in 1913, graduated at Rush Medical College in 1914 and served his internship at the Presbyterian Hospital, Chicago. Dr. Smith was a member of the staff at Rush Medical College from 1916 to 1924, serving as assistant, associate and instructor in medicine and assistant professor of clinical medicine. He went to the State University of Iowa College of Medicine, Iowa City, in 1924 as professor of the theory and practice of medicine and head of the department, a position he held at the time of his death.

Dr. Smith served as first lieutenant in the medical corps of the army in 1918. He had been a member of various national and local groups, including the American College of Physicians, American Society for Clinical Investigation, American Physiological Society, Society for Experimental Biology and Medicine, Chicago Institute of Medicine and the Chicago Society of Internal Medicine, and a specialist certified by the American Board of Internal Medicine. He was secretary of the Section on the Practice of Medicine of the American Medical Association from 1937 to 1940, when he became chairman for a year. He was also a member of the House of Delegates from the Section on the Practice of Medicine from 1944 to 1945. He wrote "The Coronary Arteries" in Cyclopedia of Medicine in 1932 and "Diseases of the Heart" in the textbook of medicine by Musser as well as numerous medical articles. He was editor in chief of the *American Heart Journal.*

Rachelle S. Yarros, La Jolla, Calif.; Woman's Medical College of Pennsylvania, Philadelphia, 1893; born in Russia, May 18, 1869; professor of social hygiene emeritus at the University of Illinois College of Medicine in Chicago, where she had been associate professor of obstetrics; fellow of the American College of Surgeons; formerly obstetrician at the Chicago Lying-In Hospital and Dispensary and consultant for the U. S. Public Health Service; for ten years at the West Side Hospital Dispensary in Chicago; served in the woman's division of the Illinois Council of National Defense during World War I, chairman of the Social Hygiene Council in Chicago and secretary of the Illinois Social Hygiene League; honorary member of the American Social Hygiene Association; author of "Modern Woman and Sex"; died March 17, aged 76, of heart disease.

Samuel Laban Ledbetter Jr. ⊕ Birmingham, Ala.; Johns Hopkins University School of Medicine, Baltimore, 1910; born in Birmingham in 1886; past president of the Jefferson County Medical Society; professor of clinical surgery at the Medical College of Alabama; member of the founders group of the American Board of Surgery; member of the Southern Surgical Association; fellow and member of the board of governors of the American College of Surgeons; served as vice president of the Southern Surgical Association; on the staffs of the St. Vincent's, Children's and Hillman hospitals; at one time clinical assistant in surgery at Western Reserve University School of Medicine, Cleveland, died March 10, aged 60, of a tumor.

Howard E. Jones ⊕ Circleville, Ohio; Medical College of Ohio, Cincinnati, 1876; born in 1853; taught physiology at Columbus Medical College for six years and later lectured on physiology at Kenyon College; past president and vice president of the Pickaway County Medical Society; on the staff of the Berger Hospital; a co-founder of the Ohio History Day Association; author of "Nests and Eggs of Birds of Ohio"; surgeon for the Pennsylvania Railroad, Norfolk and Western Railroad and the Chesapeake and Ohio Railroad; died December 12, aged 92, of senility.

Joseph de Benneville Abbott, Bristol, Pa.; Hahnemann Medical College and Hospital of Philadelphia, 1887; at one time medical examiner in the local public schools; died January 18, aged 79, of arteriosclerosis and myocardial failure.

Geza Manuel Aczel ⊕ Cincinnati; Magyar Királyi Pázmány Petrus Tudomanyegyetem Orvosi Fakultasa, Budapest, Hungary, 1909; died January 16, aged 63, of coronary thrombosis.

Morgan Kime Adams, Atascadero, Calif.; College of Medical Evangelists, Los Angeles, 1939; interned at the Los Angeles County Hospital, Los Angeles; began active duty as a first lieutenant in the medical corps, Army of the United States, on Nov. 1, 1940; later promoted to captain; served with the Third Division in the European Theater and in North Africa, receiving the Silver Star for heroic service in Sicily; relieved from active duty in April 1945; died in Riverside December 2, aged 30, of pneumonia.

Walter Henderson Allyn ⊕ Waverly, Ill.; Barnes Medical College, St. Louis, 1902; formerly mayor of Waverly; served during World War I and on the grade and high school boards of education; member of the visiting staffs of the Passavant Memorial Hospital and Our Saviour's Hospital, Jacksonville, where he died January 3, aged 70, of mesenteric thrombosis.

Charles Frederick Attwood ⊕ Topeka, Kan.; Kansas Medical College, Medical Department of Washburn College, Topeka, 1906; died in Kansas City, Kan., December 25, aged 63, of coronary occlusion.

Albert J. Auro ⊕ Brooklyn; Regia Università di Napoli Facoltà di Medicina e Chirurgia, Italy, 1923; on the staff of St. Catherine's Hospital, where he died January 1, aged 47, of pneumonia.

Jacob Valentine Baker, Edinburg, Ind.; Hospital College of Medicine, Louisville, Ky., 1898; member of the American Medical Association; died in the Bartholomew County Hospital, Columbus, January 11, aged 76, of injuries received when the automobile in which he was driving was struck by a truck.

William Evan Baker ⊕ Genoa, Ill.; Harvey Medical College, Chicago, 1904; past president of the Aux Plaines Branch of the Chicago Medical Society; for many years school physician in Genoa; on the staff of the Sycamore (Ill.) Hospital; died January 27, aged 82, of coronary occlusion.

Samuel Ralston Bates, Wagoner, Okla.; Vanderbilt University School of Medicine, Nashville, Tenn., 1897; member of the American Medical Association; served as president of the Wagoner County Medical Society; died January 11, aged 73, of valvular heart lesion and pulmonary tuberculosis.

Glenn Day Batten ⊕ Jackson, Tenn.; University of Tennessee College of Medicine, Memphis, 1933; fellow of the American College of Surgeons; served as vice president of the Tennessee State Medical Society; past president of the Madison County Medical Society; one of the founders and owners of the Doctors Hospital; on the staff of the Western State Hospital, Bolivar; died January 6, aged 42, of lobar pneumonia.

James E. Brittain, Searcy, Ark. (licensed in Arkansas in 1903); died December 12, aged 73, of cardiovascular renal disease.

Robert Henry Burke ⊕ St. Johnsbury, Vt.; the Hahnemann Medical College and Hospital, Chicago, 1902; health officer; member of the board of directors of the Brightlook Hospital; died December 1, aged 71, of carcinoma of the prostate.

Henry Herbert Clark, Woodbury, N. J.; University of Pennsylvania Department of Medicine, Philadelphia, 1891; county physician; died December 31, aged 76, of chronic bronchitis and myocarditis.

Benita Coolidge Davenport ⊕ Middleton, Mass.; Boston University School of Medicine, 1930; member of the American Sanatorium Association, American Trudeau Society and the National Tuberculosis Association; diplomate of the National Board of Medical Examiners; served as senior physician to the Essex Sanatorium, where she died December 20, aged 57, of pulmonary tuberculosis.

Denias Dawe, Monroe, Mich.; University of Michigan Homeopathic Medical School, Ann Arbor, 1889; served as mayor of Monroe, state senator and member of the state house of representatives; died December 21, aged 86, of hypostatic pneumonia and diabetes mellitus.

Nicholas Daniel Drummey ⊕ Boston; Harvard Medical School, Boston, 1887; an Affiliate Fellow of the American Medical Association; consultant on the staff of the Faulkner Hospital; died in Brookline December 17, aged 80, of arteriosclerosis.

Julius Karl Egge, Newark, N. J.; University of the City of New York Medical Department, 1890; also a graduate in pharmacy; an organizer and first secretary of the New Jersey College of Pharmacy; on the staff of St. Michael's Hospital; died December 19, aged 89, of arteriosclerotic heart disease and senility.

Anthon Flath, Stanley, N. D.; Trinity Medical College, Toronto, Ont., Canada, 1892; Victoria University Medical Department, Coburg, Ont., 1892; county health officer; died December 4, aged 82, of cardiac decompensation.

Andrew M. Flynn, Tacoma, Wash.; John A. Creighton Medical College, Omaha, 1904; member of the American Medical Association; on the staffs of the Tacoma General Hospital and St. Joseph's Hospital, where he died December 28, aged 73, of cerebral hemorrhage and arteriosclerosis.

Lee McCloskey Goodman ⊕ Jersey Shore, Pa.; Jefferson Medical College of Philadelphia, 1904; served in France during World War I; past president of the Lycoming County Medical Society; medical examiner for the Equitable Life Insurance Company; died recently, aged 64, of coronary occlusion.

James Joseph Goodwin, Clinton, Mass.; Jefferson Medical College of Philadelphia, 1892; member of the American Medical Association and the New England Surgical Society; fellow of the American College of Surgeons; surgeon, Clinton Hospital; consulting surgeon, Community Memorial Hospital, Ayer; died December 29, aged 80, of cerebral hemorrhage.

Francis Walter Gravelle, New York; Queen's University Faculty of Medicine, Kingston, Ont., Canada, 1911; member of the American Medical Association; fellow of the American College of Surgeons; attending obstetrician, Misericordia Hospital; director of obstetrics, St. Clare's Hospital, where he died recently, aged 59, of leukemia.

Augustus Clarkson Grove, Cadiz, Ohio; Starling Medical College, Columbus, 1889; served as coroner of Hamilton County and as director of the First National Bank in Jewett; died December 22, aged 81, of arteriosclerosis.

Karl Lowell Hayes, Farmersville, Ill.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1906; served during World War I; on the staffs of St. John's and Memorial hospitals, Springfield and St. Francis Hospital, Litchfield; died December 14, aged 63, of heart disease.

John Simon Jorczak, Chicopee, Mass.; College of Physicians and Surgeons, Boston, 1931; member of the draft board during World War II; died in Springfield December 25, aged 53, of coronary thrombosis.

Julius Eugene Kinney, Denver; University of the City of New York Medical Department, New York, 1885; member of the American Medical Association; died November 22, aged 89, of cardiovascular renal disease and prostatic hypertrophy.

William Adolph Kluegel, St. Louis; Washington University School of Medicine, St. Louis, 1908; member of the American Medical Association; at one time coroner of Perry County; member of the honorary staff of the Lutheran Hospital, where he died December 16, aged 62, of cardiac decompensation.

Francis Valentine Langenderfer ⊕ St. Paul; Chicago College of Medicine and Surgery, 1907; on the staffs of the Bethesda Hospital, St. Luke's Hospital and St. Joseph's Hospital, where he died November 26, aged 60, of hypertensive heart disease.

Jacob Lattman ⊕ New York; Columbia University College of Physicians and Surgeons, New York, 1917; served on the staff of the Willard Parker Hospital; died in the Mount Sinai Hospital December 18, aged 56, of metastatic carcinoma of the brain.

William Patrick Lawler, Lowell, Mass.; College of Physicians and Surgeons, Baltimore, 1886; member of the American Medical Association; past president of the Middlesex North District Medical Society; formerly a member of the local board of health and city physician; for many years on the staff of St. John's Hospital; died December 7, aged 86, of coronary occlusion.

Thomas Welford Lear, Coshocton, Ohio; Eclectic Medical Institute, Cincinnati, 1894; member of the American Medical Association; died in a local hospital recently, aged 74, of bronchopneumonia.

Edward De Witt Leonard ⊕ Newton, Mass.; Harvard Medical School, Boston, 1913; fellow of the American College of Surgeons; on the staff of the Newton Hospital, where he died December 15, aged 60, of hypertensive heart disease.

Roscoe Conklin Leinbach ⊕ Onaga, Kan.; University Medical College of Kansas City, Mo., 1907; president of the Pottawatomie County Medical Society; chairman of the county medical examining board during World War II; surgeon for the Union Pacific Railroad; died December 21, aged 61, of coronary thrombosis.

Oswald Henry Magaret, Papillion, Neb.; St. Louis College of Physicians and Surgeons, 1899; Omaha Medical College, 1900; served during World War I and as a member of the board of education; died December 28, aged 68, of coronary thrombosis.

Samuel Lee Magness, Baltimore; University of Maryland School of Medicine, Baltimore, 1902; served on the staff of St. Joseph's Hospital; died in Rock Hall November 27, aged 67, of cerebral hemorrhage.

Charles Henry Mason, Superior, Wis.; Minneapolis College of Physicians and Surgeons, 1899; member of the American Medical Association; past president of the Douglas County Medical Society; formerly city health officer; served as chief of staff at St. Joseph's Hospital, St. Mary's Hospital and St. Francis Hospital; past president and honorary member of the Rotary Club; died December 30, aged 72, of paralysis agitans.

Andrew Patterson McArthur, Moss Point, Miss.; Medical College of Alabama, Mobile, 1885; member of the American Medical Association; on the staff of the Jackson County Hospital, Pascagoula; died December 5, aged 83, of bronchopneumonia and cardiorenal disease.

Mary Elizabeth McMenamy, Brooklyn; University and Bellevue Hospital Medical College, New York, 1925; died in Danville, Va.; December 24, aged 47, of a tumor.

Douglas Gordon Meighen ⊕ Tampa, Fla.; Vanderbilt University School of Medicine, Nashville, Tenn., 1923; for many years associated with the U. S. Public Health Service; formerly county physician; district surgeon for the Atlantic Coast Line Railroad; died in the Municipal Hospital December 3, aged 47, of cardiac decompensation.

Jacob Edward Meisenbach ⊕ Staplehurst, Neb.; University of Nebraska College of Medicine, Omaha, 1904; served as president of the Seward County Medical Society; died in St. Elizabeth's Hospital, Lincoln, December 9, aged 69, of myocardial infarct.

Casper Otto Miller, New Market, Va.; University of Virginia Department of Medicine, Charlottesville, 1880; University of the City of New York Medical Department, New York, 1881; member of the American Medical Association; member of the state house of delegates, 1913-1914; died December 16, aged 88, of cerebral hemorrhage.

Julius Shuford Mitchell, Rome, Ga.; Vanderbilt University School of Medicine, Nashville, Tenn., 1894; died December 28, aged 72, of heart disease.

John H. Morrow, Merna, Neb.; Lincoln Medical College of Cotner University, 1902; member of the American Medical Association; died December 10, aged 73, of gastric hemorrhage.

Serenus Lazarus Newman ⊕ New York; Columbia University College of Physicians and Surgeons, New York, 1901; associate in obstetrics at the Beth Israel Hospital, where he died December 28, aged 68, of pulmonary embolism.

James Harper North Jr., New York; University of the City of New York Medical Department, New York, 1887; for many years associated with the New York Life Insurance Company; died December 1, aged 81, of coronary arteriosclerosis and thrombosis.

William Lucas Perry, St. Louis; Eclectic College of Physicians and Surgeons, Indianapolis, 1891; also a minister; died in December, aged 82, of coronary occlusion.

Roy Elliott Peters, Wymore, Neb.; Loyola University School of Medicine, Chicago, 1916; served as city and county physician; on the staff of the Lutheran Hospital in Beatrice; died in the Lincoln (Neb.) General Hospital, November 29, aged 60, following an operation for intestinal obstruction.

I. C. Power, Hiram, Ga.; Georgia College of Eclectic Medicine and Surgery, Atlanta, 1906; died November 16, aged 69, of carcinoma of the stomach.

George Richard Randall, Milwaukee; Queen's University Faculty of Medicine, Kingston, Ont., Canada, 1905; member of the American Medical Association; served during World War I; died in the Veterans Administration Facility December 12, aged 63, of coronary occlusion.

Charles William Robinson ⊕ Atchison, Kan.; Kansas Medical College, Medical Department of Washburn College, Topeka, 1913; past president of the Atchison County Medical Society; served as a member of the state board of health, city and county health officer and examiner for the U. S. Veterans Bureau; served during World War I; division surgeon for the Missouri Pacific Railroad; on the staff of the Atchison Hospital; died December 20, aged 55, of hypertensive cardiovascular disease.

Clarke Rogers, Indianapolis; Medical College of Indiana, Indianapolis, 1899; member of the American Medical Association; captain during World War I; member of the city board of health from 1933 to 1936 and in 1944; served on the city merit commission from 1941 to 1944; a trustee of the Soldiers' Home in Lafayette from 1920 to 1933; died December 21, aged 68, of coronary occlusion and cardiovascular disease.

Evan O. Shellhorse, Dalton, Ga.; Georgia College of Eclectic Medicine and Surgery, Atlanta, 1900; died November 19, aged 66.

Frank Siedenburg, Portsmouth, Ohio; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1907; member of the American Medical Association; since 1942 assistant medical examiner for the Norfolk and Western Railway; for many years on the staff of the Schirrman Hospital; died November 1, aged 65, of coronary occlusion.

Joseph Simecek, Swanton, *Neb.; Rush Medical College*, Chicago, 1894; member of the American Medical Association; died in the Misericordia Hospital, New York, November 2, aged 78, of cerebral thrombosis.

Frank Dale Smith ⊕ Rochester, Minn; University of Minnesota College of Medicine and Surgery, Minneapolis, 1905; died December 5, aged 64, of cerebral hemorrhage.

Lee Whitmore Smith ⊕ Butte, Mont.; University of Minnesota Medical School, Minneapolis, 1916; specialist certi*fied by the American Board of Otolaryngology; member of the* Pacific Coast Oto-Ophthalmological Society; fellow of the American College of Surgeons; on the staff of the Murray Hospital; died November 18, aged 53.

William Spickers ⊕ Paterson, N. J.; Columbia University College of Physicians and Surgeons, New York, 1906; born in Paterson, N. J., Aug. 17, 1883; fellow of the American College of Surgeons; past president of the Passaic County Medical Society; attending surgeon, Nathan and Miriam Barnert Memorial Hospital; attending thoracic surgeon, Bergen Pines *Hospital, Oradell; consulting surgeon, Hackensack Hospital,* Hackensack; died in Franklin Lakes December 28, aged 62, of coronary sclerosis and endocarditis.

***John Adams Stanfield**, Fort Worth, Texas;* Vanderbilt University School of Medicine, Nashville, 1920; member of the American Medical Association; died in the Methodist Hospital November 4, aged 50, of acute bronchopneumonia.

Richard Francis Tobin ⊕ Washington, D. C; Georgetown University School of Medicine, Washington, 1905; died December 21, aged 73, of cardiovascular renal disease.

Fred Charles Tyree ⊕ Agenda, Kan.; University of Kansas School of Medicine, Kansas City, 1906; died November 24, aged 62, of coronary occlusion.

Frederick Peterson Wainwright, Bridgeton, N. J.; Medico-Chirurgical College of Philadelphia, 1901; member of the American Medical Association; served as county physician, *died December 14, aged 83*, of cachexia and carcinoma of the lip

Alex S. Wolf, St. Louis; Medizinische Fakultat Wien, Vienna, Austria, 1900; died December 1, aged 75, of acute pulmonary edema.

James Trenton Word, Sweet Home, Ark. (licensed in Arkansas in 1903); member of the American Medical Association; physician to the *Arkansas* Confederate *Home*; died December 1, aged 71, of heart disease.

Nathan Albert York ⊕ Lisbon, Iowa; State University of *Iowa College of Medicine, Iowa City, 1900; died in* St. Petersburg, Fla., December 3, aged 79, of coronary occlusion.

Augustus G. Zimmerman ⊕ Chicago; Kaiser-Wilhelms-Universität Medizinische Fakultät, Strassburg, Germany, 1899; at one time assistant professor of clinical surgery at the University of Illinois College of Medicine and associate clinical professor of surgery at the Loyola University School of Medicine; *fellow of the* American College of Surgeons; on the staffs of the Grant Hospital, St. Elizabeth's Hospital and the Alexian Brothers' Hospital, where he died December 20, aged 67, of *glomerulonephritis.*

Capt. Harry Herbert Friedman
M. C., A. U. S., 1917-1945

Lieut. George Harley Moseley III
(MC), U. S. Navy, 1915-1945

Lieut. Arthur L. Rich,
M. C., A. U. S., 1917-1945

John Washington Thomason, East Point, Ga.; Southern College of Medicine and Surgery, Atlanta, 1912; Atlanta School *of Medicine, 1913; member of* the American Medical Association; died December 19, aged 65.

KILLED IN ACTION

Harry Herbert Friedman, Brooklyn; Georgetown University School of Medicine, Washington, D. C., 1943; interned at the Cumberland Hospital; diplomate of the National Board of Medical Examiners; began active duty as a first lieutenant in the medical corps of the Army of the United States in January 1944 and later promoted to captain; killed in action in Germany March 24, 1945, aged 27.

George Harley Moseley III ⊕ Passed Assistant Surgeon, Lieutenant, U. S. Navy, Metropolis, Ill.; University of Illinois College of Medicine, Chicago, 1940; interned at the U. S. Naval Hospital in Mare Island, Calif.; commissioned an acting assistant surgeon, lieutenant (jg) in the U. S. Navy on Aug. 15, 1939; promoted to lieutenant; missing in action as of March 1, 1942, when the U. S. S. *Asheville*, on which he was serving, was reported lost as a result of enemy action in the Asiatic Area; aged 30; presumptive date of death Nov. 25, 1945, according to the Navy Department.

Arthur Lynton Rich, Great Neck, N. Y.; New York Medical College, Flower and Fifth Avenue Hospitals, New York, 1942; interned at the Morrisania City Hospital in New York; diplomate of the National Board of Medical Examiners; began active duty as a first lieutenant in the medical corps, Army of the United States, on Aug. 13, 1943; posthumously awarded the Bronze Star Medal "for heroic action in connection with military operations against the enemy from Feb. 28, 1945 to March 6, 1945 in Germany"; died in Germany March 7, 1945, aged 27, of wounds received in action.

British Medical Association Prepares to Fight the Government

The British Medical Association is preparing to fight the government if it should prove obdurate to the views of the medical profession. The council of the association will establish an emergency guaranty fund to further the cause of the medical profession in major disputes with the government. The fund will be divided as follows: Fund A will provide for administrative, propaganda and similar expenses. Fund B will be used for these purposes and also for compensation of individual practitioners who suffer exceptional financial hardship (because of adherence to the cause of the profession). The British Medical Association has guaranteed $400,000 to fund A. Every member of the profession is urged to guarantee at least $100. The fund will remain in the form of guaranties to be called in at the discretion of the council of the British Medical Association. Should fundamental disagreement arise with proposals of the government, the medical profession will attempt to influence public opinion in order that pressure may be brought on Parliament to modify objectionable features of the bill. If this fails it is possible that physicians will not work under the new service. Treatment of patients would not be refused but would be continued outside the new service. If payment of fees is refused by patients on the basis that the bill entitles them to free treatment, then it has been suggested that the treatment will be given free of charge and the physician compensated from the fund.

Appalling Conditions in India's Dairy Industry

A report to the government of India by Mr. R. A. Pepperall, chief executive officer of the British Milk Marketing Board, reveals appalling conditions in India's dairy industry. The efficiency of the industry is considered by the author to be the lowest in the world. Adulteration by adding water to milk was usual at all stages of distribution from producer to consumer. In Calcutta the added water exceeded 25 per cent. The conditions of milk production in Indian stables are described as "starvation of stock, squalor, filth, ignorance or indifference toward hygienic principles, and revolting personal habits, allied to official apathy." At one Bombay stable housing hundreds of animals, in which conditions might be regarded as normal, the author observed crows feeding from a dead buffalo and then drinking from milk containers. At another stable the buffaloes were allowed to immerse themselves daily in a backwater in which was deposited the urine of 500 animals and in which there were dead animals. Udders were not washed before milking. Official reports showed a bacteria count of 36 million per cubic centimeter for Bombay milk. Although milk production in India is declining, the population is increasing. The price of milk is the highest in the world. The author points out the unparalleled dimensions of the problem of reorganizing an industry consisting of 22 million illiterate and poverty stricken producers with semistarved livestock.

Restoration and Enlargement of the Royal College of Surgeons

At the Hunterian dinner of the Royal College of Surgeons the president, Sir Alfred Webb-Johnson, announced that plans were being made for restoration of the famous Hunterian Museum, which had been damaged by German bombs. Help and encouragement had been received from all parts of the world. The Bernhard Baron trustees provided an endowment for experimental research, so that in their preoccupation with more material things this work would go on without interruption. It was decided that the museum needed men to take charge of the sections of anatomy and of pathology and they were fortunate to secure the services of Professor Willis from Melbourne and Professor Wood-Jones from Manchester. Sir William Collins had provided endowments of $1,000,000 for the scientific departments. In providing the means for carrying out their plans the response of fellows of the college had been inspiring at home and abroad, and also help had been received from all quarters of the profession. The plans provided for an enlarged museum space, extension of research, rooms for separate study, common rooms for postgraduates from all parts of the world, extensions of the library, and a great conference hall. The Wellcome trustees had made a magnificent gift, and valued equally with the gift were their collaboration and the help of Sir Henry Dale, so that a group of medical museums might be established in London that would be a mecca for students of all countries. Thus they carried on the great Hunterian tradition.

Penicillin Treatment of Syphilis in the British Army

Lieut. Col. James Marshall recently discussed the use of penicillin in the treatment of syphilis at a meeting of the Section of Experimental Medicine and Therapeutics of the Royal Society of Medicine. Although at least five years is required to evaluate any method of treating early syphilis, large scale experiments have allowed certain conclusions to be drawn. Treatment consisted mainly in intramuscular injections of aqueous solutions of penicillin. Almost independently of the total dosage spirochetes disappeared from surface lesions in about twelve hours, lesions healed rapidly and serologic reactions became negative. In 270 cases of early syphilis treated with 2,400,000 units of penicillin for seven and one half days and followed for six months the failure rate was 8 per cent, in contrast to a 2 per cent failure rate in an equal number of cases treated by the twenty day arsenoxide and bismuth method. Based on an American observation of probable synergism between penicillin and arsenoxide, the author has adopted a combined method of penicillin (2,400,000 units in seven and one half days) and arsenic (ten daily injections of oxophenarsine hydrochloride). Arsenical reactions were rare. If reactions did occur, arsenic therapy was discontinued and the total dose of penicillin was then increased to 4,000,000 units (one hundred injections of 40,000 units each). Approximately one third of these cases have been followed for four to six months after completion of treatment. Three cases of mucocutaneous relapse have occurred but none have shown serologic relapse. From these results the author concludes that combined therapy is preferable to penicillin alone. This method of treatment is now routine in British army hospitals.

An Industrial Resettlement and Research Bureau

The great efforts that have been made during and since the war for the rehabilitation and resettlement of the disabled have been described in previous letters to THE JOURNAL. At a meeting of the British Council for Rehabilitation it was resolved that an industrial resettlement and research bureau should be established. It was suggested that a committee of twelve industrialists be formed with power to include additional professional and technical experts to frame the terms of reference and structure of the bureau for later approval. There are approximately 2,000,000 disabled men for whom everything possible should be done to enable them to compete as nearly on equal terms as possible with the able bodied. Mr. Aneurin Bevan, minister of health, stated that ill afforded enormous waste was involved in not getting the disabled into work which they could perform.

SWEDEN

(From Our Regular Correspondent)

STOCKHOLM, March 2, 1946.

Americans Elected Members of Swedish Academy of Science

At a recent meeting Prof. H. S. Gasser of the Rockefeller Institute, New York, and Prof. E. D. Merrill, director of the Arnold Arboretum of Massachusetts, were elected members of the Swedish Academy of Science. D. M. S. Watson of London, professor of zoology and comparative anatomy, was also honored. At the same meeting several grants for medical research were announced, including one of 2,200 kronor to Dr. Nils Emmelin of Lund for an investigation of histamine in blood plasma.

As a subsequent meeting of the academy the following grants from the Nobel Fund were made: 4,000 kronor from the physics fund to Dr. Sten von Friesen of Uppsala for a study of the structure of the lower border of the continuous x-ray spectrum; 8,400 kronor from the same fund to Prof. Lise Meitner for researches in nuclear physics and 4,000 kronor to Prof. O. Klein for a continuation of studies of the quantum treatment of the magnetic properties of crystals. From the chemistry fund Prof. The Svedberg was granted 9,000 kronor for a continuation of investigations of the mass and structure of protein molecules and their reactions; Prof. H. von Euler, 9,500 kronor for study of metabolism in isolated cell nuclei and the histones of certain nucleic acids; Prof. Gunnar Hagg, 4,000 kronor for x-ray researches in crystals; Prof. Arne Fredga, 5,000 kronor for work on optically active compounds, and Prof. Karl Myrbäck, 5,000 kronor for the purchase of a Charples supercentrifuge.

Serious Lack of Medicines in Finland

The present deficiency of drugs in Finland is said to constitute a direct threat to public health. Dozens of prescriptions are left unfilled daily because of the lack of suitable ingredients. The hospitals are having great difficulty in treating their patients, and although ether is manufactured in Finland, the iodine needed for surgery is completely gone. A great many drugs previously were imported from Sweden, but currency difficulties have curtailed this source. England is at present unable to ship drugs to Finland, and the Finns had placed their hope in America. However, the trade agreement with the United States is not clear, so that the situation promises to be difficult for many months to come.

Danish Tobacco Cause of Oral Inflammation

A widespread form of oral inflammation, difficult to treat, is troubling physicians and dentists in Denmark. It is believed that its severe character is due to the poor quality of the Danish tobacco, which irritates the mucous membrane, leaving it less resistant to infection. Many patients, not realizing that they are suffering from this inflammation, merely feel extremely tired, and Danish doctors believe that in these cases the infection has become generalized.

Swedish Doctors Assist Their Neighbors

Swedish physicians and medical associations have contributed generously to a fund which has made it possible for their Scandinavian colleagues from Finland, Norway and Denmark to study medicine in Swedish schools and hospitals. This aid is also extended to physicians from neighboring countries attending conventions in Sweden, who are allowed to take only a small amount of money with them out of their own countries (barely enough to support them for a day).

Committee for Testing the Durability of Drugs

The Committee for the Testing of the Durability of Drugs has recently been formed, consisting of representatives from the Royal Pharmaceutical Institute, the Federal Pharmaceutical Laboratory, the Military Apothecary, the pharmaceutical industry and apothecaries' organizations. The committee will collect literature on the subject, particularly on those drugs whose lasting qualities are important for economic or other reasons, and then begin experimentation. The present literature on the subject is meager, and continued investigation is needed. It is hoped that considerable waste may be avoided by knowledge of how long drugs can be safely stored without loss of potency.

Chilean Pediatrician in Stockholm

Dr. Gabriel Solar, pediatrician, the daughter of Chile's chargé d'affaires in Oslo, has been sent to Sweden by the Chilean government to study the methods used in Swedish children's hospitals and pediatrics. She will also study in Norway before returning to Chile.

Swedish Association of Industrial Physicians Established

In February, Swedish industrial physicians established an association, as a branch of the Swedish Medical Association, to further knowledge and investigation in the field of industrial health.

Cellophane Tubes for Blood Transfusions

A satisfactory cellophane tube is now produced in Sweden for blood transfusions which will avoid the difficulties encountered by the use of rubber tubing.

PARIS

Feb. 26, 1946.

Epidemic of Plague in Corsica

On February 14 at a meeting of the Society of Comparative Biology, Lucien Bernard, inspector of public health for the Department of the Seine, described an epidemic of plague which occurred in Adjaccio, Corsica, during the summer of 1945. Bubonic plague had been unknown there until this time. Between May 11 and June 13, 1945 there were 13 cases, with 10 deaths. The disease was introduced by infected rats that arrived on ships from the Mediterranean basin, where it was epidemic at the time. The island was quarantined and the entire population of Ajaccio, 25,000 inhabitants, was vaccinated with a vaccine of killed bacilli prepared by the Pasteur Institute. Two vaccinations of 1 and 2 cc. were given at an interval of eight days. Many thousand rats were systematically destroyed by squill and arsenic anhydride. Disinfestation was performed by special teams with 5 per cent DDT powder. It was found that one tenth of the rats were of the Rattus alexandrinus type, which propagates plague. There was an average of two fleas per rat, 70 per cent of the fleas being also of the type which transmits plague. The author reported that the epidemic probably was stopped because of the small number of fleas resulting from climatologic conditions in 1945 and the sanitary measures instituted. At the same meeting Girard called attention to the efficacy of vaccination against plague with attenuated living bacilli. Robic and Girard had used this vaccine successfully in Madagascar where 800,000 inhabitants were vaccinated annually for several years. Use of the vaccine over a period of eight years proved that it was innocuous and that its administration caused a decrease of morbidity which was parallel with the number of vaccinations.

New Technic of Infiltration of Stellate Ganglion

Seze, Ryckwaert, Guegen and Roisin have described a technic of infiltration of the stellate ganglion based on two years' experience with a thousand infiltrations and radiologic evidence. The authors point out that the problem involved is to reach the stellate ganglion by the shortest route without pain or accident. They made preliminary studies on cadavers. The patient is placed on his back with the head turned at a 45 degree angle to the side opposite the infiltration site. Three lines are drawn, the first from the edge of the tragus to the medial end of the clavicle, the second parallel and one fingerbreadth (1 to 1.5 cm.) posterior to the first line, the third parallel and two fingerbreadths superior to the clavicle. The site of injection is at a point where the second line intersects the third line. Subcutaneous planes are anesthetized, a thin needle (of 0.5 mm. bore and 5 to 6 cm. long) being used. The jugular and carotid structures are pressed back toward the sternum by the left index and middle fingers placed above and below the point of injection. With the right hand the needle is then inserted straight back vertically or at a slight angle of 15 degrees for 3 or 4 cm. until the internal extremity of the neck of the first rib is reached. Procaine hydrochloride 1:200, 20 to 25 cc., is injected. The patient is then placed in a half sitting position so that the solution can pass along the stellate ganglion. The authors report that the method is painless and because of its ease avoids certain drawbacks of other methods. Its harmlessness has been established. Painful lesions of the brachial plexus are unusual, and no pleuropulmonary wounds have occurred. Danger to large blood vessels is avoided by the position of the head and pressure of underlying structures away from the point of injection. In about one of twenty to thirty infiltrations the vertebral artery is encountered. The needle is then withdrawn and pressure with a tampon is applied for a few minutes. The operation may then be repeated again at a more oblique angle.

The Anemia from Antiplatelet Serum and from Estradiol

Drs. Walter Cruz, E. M. da Silva and R. Pimenta de Mello, from the Division of Hematology of the Oswaldo Cruz Institute of Rio de Janeiro, studied the relation between thrombocytopenia, anemia and the hemorrhagic intestinal lesions caused by estradiol benzoate and antiplatelet serum.

Estradiol benzoate in large doses (0.1 mg. per kilogram) produces thrombocytopenia in dogs after four to six days. As a result of the decrease of platelets in the circulating blood (one third to one tenth of the normal) a picture of purpura appears, with predominance of intestinal hemorrhages followed by severe anemia. When active antiplatelet serum is administered to dogs, thrombocytopenia is rapidly obtained within twelve to forty-eight hours. Intestinal lesions of purpura are conspicuous, and hemorrhages with acute anemia are usually present. These results seem to indicate the identity of the mechanism of anemia produced by estradiol benzoate and by antiplatelet serum. The practical value of the determination of occult blood in feces of patients with thrombocytopenic purpura is emphasized by the authors as an aid to the diagnosis of crises of Werlhof's disease.

The Montenegro Reaction in Leprosy

The concomitant occurrence of leprosy and cutaneous leishmaniasis has been reported by several investigators and is important in the early diagnosis of both diseases. Dr. S. C. Arantes of São Paulo recently published a report of investigations of the Montenegro intradermal reaction in patients with leprosy, which, in summary, showed that (1) the Montenegro reaction was negative in all cases of leprosy without previous history of leishmaniasis, (2) the reaction was always strongly positive in leprosy patients with a probable history of leishmaniasis twenty or more years earlier, (3) the reaction was not modified by leprosy in cured cases of leishmaniasis and (4) a negative reaction was obtained in 1 patient in whom leishmaniae were demonstrated in the ulcer. These results have been confirmed by Dr. Josefino Aleixo and Dr. Joel T. Coelho, Division of Leprosy, Minas Gerais State Department of Health, in a study of the Montenegro reaction in 23 selected cases of leprosy. However, in the latter series a positive Montenegro reaction was found in 1 patient with an ulcer presenting characteristics of both leprosy and leishmaniasis with many Hansen bacilli but no leishmaniae. The diagnostic value of the Montenegro reaction is emphasized for all cases in which there is a possibility of both leishmaniasis and leprosy.

Retirement of Prof. Henrique Roxo

Dr. Henrique Belfort Roxo, professor of clinical psychiatry and director of the Psychiatric Institute of the University of Rio de Janeiro, has reached the retirement age after thirty-five years of active duty at the university. Among many papers published by Dr. Roxo particular mention should be given to the report presented to the seventeenth International Congress of Medicine in London in 1913 on "Chronic Hallucinatory Systematized Delirium," which was considered at the time a new disease entity. In 1921 he published the first edition of his "Textbook of Psychiatry," which is a classic work for medical students in Brazil.

Brief Items

The State Psychiatric Hospital at Salvador, state of Bahia, has been recently improved and remodeled, and an outpatient department has been opened.

The São Francisco de Assis x-ray institute of the city of São Paulo is now offering a postgraduate course in clinical radiology, to be given in February. Drs. Rafael de Barros, Olavo Pazzanese, Carl Fried and Nelson de Carvalho will be in charge of the lectures and practical demonstrations included in the course.

Drs. Alfredo Monteiro, A. F. Costa Junior, Aurelio Monteiro and Campos da Paz Filho have been elected to the governing board of the Rio de Janeiro Medical and Surgical Association.

Drs. Hugo Firmeza, Rubens Siqueira, Abelardo Tavares and Roberto C. da Rocha have been elected to the governing board of the Brazilian Association of Industrial Medicine.

A new leprosarium bearing the name of Padre Damião has been recently opened at Ubá, state of Minas Gerais. It is a modern and well equipped institution for the care of about 1,500 patients.

A new foundation has been organized with a gift made by Mrs. Anita P. D'Angelo to build and operate a general hospital in the city of São Paulo. The institution will bear the name of Sabbado D'Angelo, a late Italian industrialist of the city.

The Department of Hospitals of the city of Rio de Janeiro has completed the plans for the building of a 400 bed general hospital at Meyer, an important northern suburb of the city.

The Special Service of Public Health, operated by the Brazilian and the American governments through the Office of Inter-American Affairs, has opened two health centers in the towns of Valladares and Aymorés, state of Minas Gerais, which will function as public health agencies for the two towns. The service has cooperated in the construction of water supply and sewerage systems for both towns.

Marriages

John Richard O'Brien, Niagara Falls, N. Y., to Mrs. Dorothy Newton Worcester in Lebanon, Mo., February 2.

Franklin Caswell Miles, Nashville, Tenn., to Miss Eugenia Frances Newsom of Sandersville, Ga., February 11.

James Edward Wheeler, Columbia, S. C., to Miss Carol Jane Allen of New York in Glencoe, Md., March 4.

Claude Henry Workman Jr., McCormick, S. C., to Miss Ruth Bennett of New Orleans, February 17.

Francis Preston Owings, Union, S. C., to Miss Carrie Shell Cathcart in Winnsboro, February 23.

Frank Princi, Boston, to Miss Eva Demchak in Osceola Mills, Pa., January 2.

Benedict Trach to Miss Dorothy Bennett, both of Minneapolis, February 12.

BRUCELLA MELITENSIS ISOLATED FROM SWINE TISSUES IN IOWA

To the Editor.—Since publication of the article entitled "Occurrence of Brucella Melitensis in Iowa" in the January 12 issue of The Journal, page 72, investigation of a case of brucellosis caused by Brucella melitensis and of the suspected source of infection has led to the isolation of Brucella melitensis from tissues of hogs in Iowa.

W. N., a man aged 32, a farmer living in Humboldt County, Iowa, had onset of illness due to brucellosis in September 1945. On September 17 Brucella melitensis was isolated from the blood clot of the specimen, which the attending physician forwarded to the State Hygienic Laboratory for the agglutination test.

The patient gave the history of direct contact with cows and hogs but not with sheep or goats. Through the Bureau of Animal Industry and State Department of Agriculture a veterinarian was authorized to secure blood specimens from cows and hogs. Cows numbering 18 showed negative agglutination tests; 4 sows were tested, 2 of which proved to be reactors.

Infected sows were sold from this farm before arrangement was made for slaughter and laboratory study. Attention was then directed to 115 "spring pigs," some of which were littered by infected sows. Of particular interest were 20 gilts, which at the time of inquiry (Dec. 20, 1945) weighed between 250 and 300 pounds. The owner (W. N.) had planned to use these animals for breeding purposes but consented to have them blood tested. When 8 of the gilts showed positive agglutination reactions, no persuasion was needed to induce the farmer to dispose of some of his hogs.

Through the courtesy of the managers of the Tobin Packing Company, Fort Dodge, special arrangement was made for slaughter of the 20 gilts from the farm of W. N. The animals were killed on Feb. 13, 1946, at which time the spleen, uterus, a kidney, a portion of the liver and various lymph glands were removed from "reactor" and "nonreactor" hogs. The tissues were transported at once to the Veterinary Research Laboratory at Ames for cultural study. During succeeding days one of us (S. H. M.) isolated twelve strains of Brucella from the swine tissues, four from reacting and eight from nonreacting gilts. Three strains were recovered from maxillary lymph glands, three from hepatic lymph nodes, five from unidentified lymph glands and one from the spleen. Bacteriologic examination of the uteri, livers and kidneys remained negative.

All of the twelve strains as submitted to the State Hygienic Laboratory proved to be Brucella melitensis, based on the following characteristics: (1) nonmotile, gram negative, pleomorphic coccobacilli; (2) agglutination of organisms by antimelitensis serum; (3) better growth with ordinary atmospheric conditions than under 10 per cent carbon dioxide; (4) a trace of hydrogen sulfide in twenty-four hours but none in forty-eight, seventy-two and ninety-six hours, and, lastly, (5) growth in twenty-four, forty-eight and seventy-two hours on tryptose agar plates containing basic fuchsin 1:25,000 and on the same medium containing thionin 1:25,000.

This is the first time in Iowa and as far as known in the United States that Brucella melitensis has been isolated from tissues of naturally infected swine.

Valued assistance in the steps which led the way to these findings was rendered by Dr. Charles L. Jones, Gilmore City; Mrs. Lynn Freifeld, senior bacteriologist, State Hygienic Laboratory, Iowa City; Mr. Fred Clark, manager and Mr. Joe Kelly, assistant manager, Tobin Packing Company, Fort Dodge; J. A. Barger, D.V.M., inspector in charge, Bureau of Animal Industry, Des Moines; C. C. Franks, D.V.M., state veterinarian, Des Moines; E. H. Pick, D.V.M., Pocahontas; Dr. M. T. Johnson, M.P.H., medical director, District Health Service No. 5, Fort Dodge.

Irving H. Borts, M.D., Iowa City.
Director, State Hygienic Laboratory.

Sam H. McNutt, D.V.M., Ames, Iowa.
Professor of Veterinary Research, Iowa State College.

Carl F. Jordan, M.D., Des Moines, Iowa.
Director, Division of Preventable Diseases and Epidemiologist, Iowa State Department of Health.

PENICILLIN IN AGRANULOCYTOSIS

To the Editor:—Our recent experience with penicillin in the treatment of thiouracil induced agranulocytosis has created in our minds a point of view at variance with the report of the Council on Pharmacy and Chemistry of February 9. We are referring to the recommendation that a daily dosage of 500,000 units is the desirable method of treatment in these cases.

In 2 recent cases prompt improvement occurred only when the dose of penicillin was increased to 1,000,000 units or more daily. It is our conviction that these larger doses of penicillin represent adequate therapy and that the dosage of one-half million units daily is a suboptimal amount of penicillin.

We urge the acceptance of this recommendation by the Council on Pharmacy and Chemistry and trust that this communication will come to the attention of men employing thiouracil in the treatment of hyperthyroidism.

Martin G. Vorhaus, M.D.
Harold H. Rothendler, M.D.
New York.

To the Editor:—In a recent article in The Journal by Boland, Headley and Hench on the "Treatment of Agranulocytosis with Penicillin" the authors cite 10 cases, including 1 of their own, which have been successfully treated to date. In their review of the literature the authors apparently failed to note a case reported by us (Russek, H. I.; Smith, R. H., and Zohman, B. L.: Subacute Bacterial Endocarditis Complicated by Agranulocytosis: Report of Case with Recovery, *Ann. Int. Med.* **22:**867 [June] 1945). In this instance a white man aged 21 with subacute bacterial endocarditis was treated with sulfonamides, from which he developed agranulocytosis. Blood culture remained persistently positive for Streptococcus viridans. Recovery from both diseases, the first to be recorded, resulted from the administration of 8,400,000 units of penicillin over a period of twenty-one days.

TREATMENT OF EPILEPSY

To the Editor:—In the March 2 issue of The Journal on page 565 De Jong in an article on the treatment of epilepsy makes the statement that "a ketogenic diet has been advocated but its efficacy is doubtful."

This is a misstatement of fact which should be promptly corrected. There is no doubt of the efficacy of the ketogenic diet in the minds of those who have used the diet or are familiar with the literature. The author quotes two references to support his statement. If he has access to his first reference, by Wilder, he will find that this article merely presents a suggestion as to the possible value of a ketogenic diet. In the second reference there are statistics to prove that the ketogenic diet was effective in 47 per cent of the children treated. There are many references in the literature since 1938 The most concrete evidence of the value of the ketogenic diet is presented in the articles which indicate a definite improvement in the electroencephalograms of patients under treatment with the diet. There are a large number of cases reported which have been treated for long periods. The ketogenic diet has been the only effective treatment of petit mal in children. Until now drugs have been totally ineffective. As most children with petit mal either have, or eventually develop, grand mal epilepsy, the greatest value of the ketogenic diet lies in the fact that it will control all the manifestations of this disease, including grand mal. It will never aggravate any one manifestation of the disease. The most effective argument for the ketogenic diet is the following quotation from "The Practice of Pediatrics" (Hagerstown, Md., W. F. Prior Company, 1945) volume 4, chapter 12, page 31, under the heading "Dietary Regimen":

> For the majority of children with genuine epilepsy this would seem at the present time to be the most important form of therapy because it apparently tends to alter the physicochemical state or the metabolic activity of the body in a direction favorable to correction of the underlying disturbance in brain cell physiology.

M. G. Peterman, M.D., Milwaukee.

Bureau of Investigation

CEASE AND DESIST ORDERS

Abstracts of Certain Federal Trade Commission Releases

The work of the Federal Trade Commission in helping to protect the public against misrepresentation or fraud in the medical as well as other fields, has been greatly extended by the provisions of the Wheeler-Lea Amendment to the Federal Trade Commission Act. The Food, Drug and Cosmetic Act of 1938 increased the Food and Drug Administration's control of the advertising claims and statements made on the label of a medicine or on the carton or in the accompanying leaflet, whereas what might be termed collateral advertising, that which appears in circulars, newspapers and magazines and over the air, comes more actively under the purview of the Federal Trade Commission by virtue of the Wheeler-Lea Amendment.

The Journal has at various times commented on the activities of the Federal Trade Commission in this connection, even before the Wheeler-Lea Amendment gave it its added powers. In some cases the Commission may accept from the person or concern involved a stipulation that the objectionable practices or claims cited will be discontinued. In other cases the Commission issues what is known as a Cease and Desist Order, in which the individual, manufacturer or distributor cited is ordered to cease and desist from practices which have been declared objectionable. In some cases the claims cited have been discontinued by the firms several months (or even longer) before the issuance of the order. Abstracts of some of the orders issued in 1943, 1944 and 1945 follow in this form: name of product, name of distributor, date of issuance of complaint, date of issuance of Cease and Desist Order and terms of order.

Brooks Rupture Appliance and Automatic Air Cushion.—Brooks Appliance Company, Harold C. Brooks and Craig W. Brooks, Marshall, Mich., New York and Chicago; complaint issued Nov. 2, 1943; order issued Jan. 29, 1944. Order directed respondents to discontinue any advertising representing that the devices mentioned constitute a competent remedy or cure for hernia. Order also directed Fogarty-Jordan-Phelps Company, Chicago, an advertising agency, to discontinue the false and misleading representations that the truss in question will do away with all discomfort and worry caused by hernia, enable the wearer to undertake and enjoy hard work and strenuous play, that in every case it will hold reducible hernia securely and comfortably in place at all times, can be depended on to assist nature in healing hernia to the extent that the need of a truss or other support will be eliminated; that it will make strangulation of hernia impossible, and that the device adjusts itself to every movement of the body, and its air cushion attachment is fully automatic and clings to any spot to which it is adjusted. The order further directed the respondents to cease representing that another Brooks device, the "Natural Uterine Supporter," is an effective treatment for uterine displacements and will relieve or cure ailments and diseases caused by displacements of the womb.

Dupree Nostrums.—Imperial Drug Exchange, Inc., trading as Dupree Medical Company, and its president, Abraham Parodney, New York; complaint issued Dec. 11, 1943; order issued May 17, 1944. Order directed respondents to discontinue any advertisement which represented that their preparations, "Dupree Brand New Formula Pills" and "Dupree Pills, Double Strength, New and Improved Formula," are a competent and effective treatment for delayed menstruation arising from colds, nervous strain, poor nutrition, anemia, over-exposure, change of climate, or from any other cause; or which did not reveal that these products should not be used in the presence of abdominal pains, nausea or other symptoms of appendicitis. It was provided, however, that it would be sufficient for such advertisement to confine its warning to the statement, "Caution: Use only as directed," if the same warning should appear on the label.

Gold Medal Haarlem Oil.—Leonard Block, Melvin Block and Betty Roberts, trading as Gold Medal Haarlem Oil Company, Jersey City, N. J.; complaint issued Nov. 7, 1942; order issued April 17, 1944. Order directed respondents to discontinue the following misrepresentations in the advertising of the product variously designated as "Gold Medal Haarlem Oil" and "Gold Medal Haarlem Oil Capsules": That its use will restore the kidneys or bladder to healthy activity; that it is a safe, effective and competent treatment for conditions described as weak kidneys, irritations of the bladder, aches, sciatica, neuritis, neuralgia, lumbago, nervousness, dizzy spells or swollen ankles; that such conditions are symptomatic of ailments which are treated successfully by the use of this preparation; that it is a remedy or cure for ailments or diseases of the kidneys, or that it has any therapeutic value in treating those conditions. The order further directed the respondents to discontinue any advertisement that did not reveal that the indiscriminate use of this product by persons whose kidneys are diseased or injured might interfere with their proper functioning, and that prolonged administration might injure normal kidneys. The order provided, however, that it would be sufficient for such advertisement to state "Caution: Use only as directed" if the instructions for use on the label contain a warning to the same effect.

Helena Volay Face Oil.—Helen E. Hoeck, trading as Helena Volay Cosmetics, Needles, Calif.; complaint issued May 28, 1943; order issued Jan. 25, 1944. Order directed respondent to cease representing that Helena Volay Face Oil will significantly improve the skin or cause it to become firmer or appear more youthful, or that it will effectively treat or prevent the formation of wrinkles and sagging tissues. The order also was directed against the Chicago Union Advertising Agency, Inc., of Chicago, which prepared and handled the advertising.

Kaytonik.—Joseph P. Kayatta and Kay Laboratories, Inc., Providence, R. I.; complaint issued Sept. 28, 1943; order issued Jan. 24, 1944. Order directed respondents to cease representing that Kaytonik is a preventive of, or effective treatment for colds, will prevent a cold from developing into la grippe, influenza or pneumonia, or will build up health, strength or bodily resistance to disease or destroy germs. Order further directed respondents to discontinue using the word Kaytonik as a trade name or otherwise representing that the product is a general tonic, and cease using the word "laboratories" or any other term implying that respondents own, operate or control a laboratory equipped for compounding medicinal preparations, and for research in connection therewith.

Pheno-Isolin Products and Dialin.—Howard J. Force, former president and manager of the Scientific Manufacturing Company, Inc., and later a partner in the Force Company, both of Scranton, Pa.; complaint issued April 11, 1941; order issued May 13, 1944. Order directed Force and his agents to cease representing that Pheno-Isolin or Pheno-Isolin Ointment is a powerful germicide of value in surgery or in treatment of peritonitis, gangrene or similar ailment; that they have any value in the treatment of stiffening of the joints, colds, sinus infections, eczema or burns; or that Dialin is efficacious for diabetes or has any value in the treatment of that condition. In an earlier action of the Federal Trade Commission against Force's concern, that outfit stipulated that it would discontinue on its labels or in advertising matter misrepresentations to the effect that Pheno-Isolin possesses antitoxic properties or acts as a "sure" germicide in the treatment of certain maladies, or that, when taken as directed, the product destroys infection, dissolves all other kinds of bacteria, or accomplishes some other things. In The *Journal* April 25, 1942, page 1512, appeared a lengthy discussion of actions brought by various government agencies against the Scientific Manufacturing Company and Howard J. Force, including a Post Office fraud order debarring the concern and the man from use of the mails for fraudulently selling its Dialin for diabetes, and a few months afterward a supplementary order covering the name H. J. Force, who had been found to be continuing the business under his own name. In the fraud case a government chemist testified that Dialin was a mixture of magnesium carbonate, sodium bicarbonate, glycerin, plant material (including rhubarb, ipecac and peppermint) a small amount of alcohol, and traces of iron, phosphate, citrate and calcium. Pheno-Isolin, according to a government chemist who testified in a case brought against the concern for violating the earlier Food and Drugs Act, was nothing more wonderful than turpentine, camphor, menthol and resin dissolved in an oil. Yet it was promoted for such conditions as cancer, boils, carbuncles, neuritis, coughs, and some other things!

Von's Pink Tablets.—George and Sadie Von Nieda and Florence Beebe, trading as Von Drug Company, Miami, Fla.; complaint issued Feb. 12, 1942; order issued Jan. 31, 1944. Order directed respondents and their agents and distributors (trading as Philadelphia Von Company, Chicago Von Company and the like) to discontinue any advertisements which represented that the tablets are an effective treatment for stomach ulcers, that they will afford prompt relief to a person suffering from a long-standing case of this condition, restore the stomach content to a better chemical balance, prevent or tend to prevent stomach ulcers from forming, or effectively coat stomach ulcers or denuded surfaces in the stomach with a protective coating.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Malpractice: Limitation of Action; False Certification of Insanity.—The plaintiff was committed to the state hospital as a result of the defendant's certification that she was insane. Contending that such certification was false and fraudulent, she filed suit for damages against the defendant physician. From an order dismissing her petition, plaintiff appealed to the Supreme Court of Missouri.

The plaintiff alleged that on Sept. 17, 1936 the defendant, a duly licensed physician, executed a certificate to the effect that he had on that day seen and examined the plaintiff and that he believed her to be insane; that defendant subsequently appeared in the county court and verified this certificate; that the plaintiff was accordingly declared insane and committed to the state hospital until December 17, when she was paroled to her husband; and that in August 1944, after a hearing in the probate court, she was officially pronounced sane. The plaintiff then alleged that during the entire time from September 1936 to August 1944 she was, in fact, sane; that defendant's certificate was false in that he did not on September 17, or at any time prior thereto, treat or examine the plaintiff for any mental disorder; and that, as a direct result of the defendant's acts, plaintiff was deprived of her liberty and rights as a citizen and has suffered, and will suffer, great pain of body and anguish of mind.

The Missouri statute of limitations provides that causes of action for malpractice (which plaintiff's counsel contend the petition sets forth) must be commenced within two years after the malpractice complained of (Mo. R. S. A., section 1016) unless the petitioner was then under a disability, in which case suit must be commenced within two years after the disability is removed (Mo. R. S. A., section 1020). Defendant contended the action was barred because it was not commenced within two years of the alleged malpractice. The plaintiff, however, argued that she, although sane, was under a disability within the meaning of section 1020 by reason of her commitment and confinement brought about by defendant's certificate, and that the two year period did not commence to run until the removal of that disability, namely the adjudication of plaintiff's sanity on Aug. 28, 1944.

It must be plainly seen, said the Supreme Court, that the plaintiff, in order to state a cause of action against the defendant, has pleaded, and would have to prove, her sanity at the time she was committed as the result of defendant's certificate. Since her action was instituted more than two years after the date of defendant's certificate, she has the burden of showing that she was under a disability within the meaning of the statute. To do so, she alleges she was insane at the time the defendant executed his certificate. The plaintiff's allegation of her sanity at the time her cause of action accrued, continued the court, surely negatives her allegation of insanity which she would have to prove in order to justify the delay in filing her action. The plaintiff urges, however, that if a physician assumes to sign a statutory certificate of another's insanity and does so untruly, without making, or without the exercise of due care in making, an examination or inquiry, then, if damage ensues, such physician should be held liable for the injury. In effect, therefore, the plaintiff argues that "insane" means not only persons actually insane but also persons actually sane but wrongfully committed as insane. At first glance, in such a case, it would seem that a court should be liberal in construing an "excepting section" in order to permit such a plaintiff's recovery, if a consequent commitment and confinement as an insane person had the practical effect of keeping the sane person from a timely commencement of his action. The court said, however, that statutes of limitations are not to be evaded except by the methods provided therein. The exceptions contained therein are strictly construed and are not enlarged by the courts on considerations of apparent hardship. The legislature of Missouri, concluded the court, did not broaden the language of the excepting section to include a sane person who, notwithstanding, is in fact disabled because wrongfully committed and confined as insane, from bringing an action; and so to broaden the section by construction would deny the effect of the plain meaning of the word "insane." The court accordingly concluded that the plaintiff's cause of action was barred by the statute of limitation, and the order of dismissal in favor of the defendant physician was affirmed.—*Woodruff v. Shores, 190 S. W. (2d) 994 (Mo., 1945).*

Malpractice: Insufficiency of Evidence to Show Malpractice in Gallbladder Operation.—The plaintiff sued for damages alleged to have resulted from the malpractice of the defendant physician. At the close of all the evidence the trial court directed a verdict in favor of the physician. Later, on motion of the plaintiff, the court entered an order granting a new trial and from such order the physician appealed to the Supreme Court of Washington.

The plaintiff's evidence showed that he had consulted the defendant physician in 1943 complaining of heartburn. After examination an operation to remove the appendix and gallbladder was advised and later performed on March 9, 1943. He went home from the hospital March 30 and from then until July the wound discharged bile and the plaintiff suffered from fevers and chills and at times coughed and vomited blood and bile. In May a piece of gauze was pulled from the wound by the plaintiff's mother. During July the defendant opened the wound on several occasions. In August defendant performed a second operation, requiring seventeen days' hospitalization, and after staying home for a while plaintiff returned to the hospital a third time. In December the plaintiff underwent an operation at the Mayo Clinic by Dr. Counseller. Returning to his home in January, he was treated by Dr. Willis and Dr. Bannick. During the next six months or so he made three more trips to Mayo's, and underwent another operation and a duodenal drainage. Between trips to the hospitals and to the different physicians, the plaintiff's wound would heal and he would suffer from fever, chills and jaundice; when the wound was opened or would break open, however, the resulting drainage would give the plaintiff some relief. The drainage ceased after the plaintiff's first trip to Mayo's but he continued to suffer from fever, chills and jaundice for a considerable time.

The defendant physician testified that the plaintiff first consulted him relative to a stomach trouble that had been present since plaintiff was a child. After making a complete physical, laboratory and x-ray examination, the physician concluded that the plaintiff's gallbladder and appendix were diseased and recommended their removal. The remainder of his testimony consisted, for the most part, of a most minute description of the actual performance of the operation of March 9. Asked if, in cutting the cystic duct, he had come close to the common hepatic duct, the defendant answered "On the contrary, I knew I had not come close to it." The doctor said the flow of bile might be due to disease or to a stricture in the remaining duct, or it might come from an accessory duct. Speaking of accessory ducts, he said that "they are not always there, but they are sufficiently frequent so that they are always in the mind of the operator and is an added reason to the ones that I have given before for putting drainage into the abdominal cavity after the removal of the gallbladder." At the hospital the plaintiff was given medicine to relieve his pain and to assist his recovery and was subjected to numerous tests to ascertain his condition. At one time the defendant had run a steel probe into the wound and bile had come out. The fact that bile was coming out through the wound indicated, in defendant's opinion, that the bile was being blocked. After his return home the defendant visited him on twenty-five occasions and on many of these visits he dressed the wound. Concerning the gauze that was pulled from the wound, the defendant testified that, in accordance with his usual procedure, a piece of gauze, mixed with iodine, or a sulfonamide compound, had been laid in the wound to assist drainage and had been changed every second or third day. It was one of those pieces that had been found by the plaintiff's family. He added, however, that gauze placed in a wound such as the plaintiff had would become infected and would smell bad, but that such condition was neither unusual nor unexpected. In August the defendant performed an exploratory laparotomy which revealed dense adhesions between the hepatic flexure and the abdominal wall. These were broken down as far as possible and "large masses" of them removed. They were caused, the defendant stated, by infected bile. He also found evidence of cirrhosis of the liver, likewise attributed to the infection.

Dr. Counseller, head of the section of general surgery at the Mayo Hospital, testified that he examined the plaintiff on December 3 and diagnosed a biliary fistula, which he said meant the drainage of the bile from an abdominal sinus or other opening or hole. During the operation which Dr. Counseller subsequently performed he found an attachment of the colon to the abdominal wall, with an opening in the colon. Asked how the hole was caused, Dr. Counseller said "That would be pretty hard for me to say. You could get a hole in the intestine from being next to an abscess and sloughing taking place, or you could get a hole in the bowel from a drainage tube that you might have in there—that is not uncommon, due to the pressure and that sort of thing." On cross examination he stated that a large amount of infection, inflammatory changes and adhesions made identification of the common hepatic duct very difficult and that he could not say that plaintiff's was not in existence. Given the history of the plaintiff's condition before and at the time of the first operation, Dr. Counseller said that while he did not pretend to be an authority on what constitutes ordinary care and customary competence in the region of Seattle, Washington, where the defendent physician practiced, in his opinion immediate surgery was not indicated at that time. He admitted on cross examination however that there could be an honest difference of opinion between competent medical men as to whether or not it would be advisable to operate on March 9 and that a physician could not be considered negligent for deciding either way.

Dr. Jacobson, who examined the plaintiff on March 17, about eight days after the first operation, testified that in his opinion the quick elevation of the temperature after the operation indicated that the bile had been infected before the operation. Asked if it was proper to allow the patient to go home a short time after the operation, Dr. Jacobson replied "Oh, yes. We let the patients go home; might as well drain at home as in the hospital. . . ."

Dr. Mosiman, who had practiced in Seattle since the first world war, was read a long hypothetical question which included a full description of the plaintiff's physical condition prior to the operation, as indicated by the plaintiff's history and the examination made by the defendant. He was then asked whether or not skilled physicians using ordinary care in this vicinity would be justified in operating for gallbladder and appendix trouble. He answered "Yes, decidedly." He also testified that a patient could have infected bile even before an operation.

Dr. Dudley, in answer to the same hypothetical question, stated "I would say these are symptoms of infection of the gallbladder which would justify an operation." He was also of the opinion that the plaintiff's condition after the operation was caused by an infection and that it was proper to allow the plaintiff to leave the hospital after his first operation.

Dr. Krantz stated that placing gauze in an infected wound and keeping the wound open and draining, to let the material out, are sound surgical measures. He was then asked if, under the condition where the surgical wound remained open, it is customary, in a surgical operation, for the surgeon to make a tract into the surgical wound through which the bile might come from some place on the inside and he answered "It would only be good surgical judgment to open the wound to allow this matter of bile to come forth."

Here we have, said the Supreme Court, a most interesting case, involving a charge of malpractice in the performance of a most difficult operation by a surgeon of many years' experience. The defendant concedes in his brief that if he cut, strictured, bruised or otherwise injured the common bile duct in either operation he would be guilty of negligence. We are unable to find any evidence which indicates that defendant in any way injured the common bile duct. Continuing, the court pointed out that the defendant in his testimony clearly and with minute detail described every step of the operation. He distinctly stated that he had not injured the common duct. His method of operation and treatment was approved by eminent physicians and surgeons, including those called by the plaintiff. It is entirely clear, said the court, that the intense pain suffered by the plaintiff was caused by the disease which necessitated the operation. Before the operation plaintiff was a sick man. He had been suffering from a disease condition of the gallbladder, brought about by infected bile. The bile remained infected after the operation. It irritated the wound and the ducts and caused the many adhesions, which in turn brought about the unsatisfactory condition which caused the plaintiff to believe that the operation had not been properly performed. There was no foreign substance left in the plaintiff's abdomen by the defendant. There was no foreign substance left in or near the wound except the gauze and other necessary dressings. Plaintiff's own witness, Dr. Bannick, was of the opinion that placing gauze in the wound and keeping the wound open and draining were sound surgical measures. In conclusion, the Supreme Court said that the great mass of evidence supplied in this case did not prove negligence on the part of the defendant. It did, on the other hand, prove that the defendant used great care in performing the operation and administering to his patient's needs after the operation. Accordingly the order of the trial court granting a new trial was reversed with instructions to dismiss the action.—*Fritz v. Horsfall, 163 P. (2d) 148 (Wash., 1945).*

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS
EXAMINING BOARDS IN SPECIALTIES

Examinations of the National Board of Medical Examiners and the Examining Board in Specialties were published in The Journal, March 30, page 896.

BOARDS OF MEDICAL EXAMINERS

Arkansas:* *Medical.* Little Rock, June 6-7. Sec., Medical Board of the Arkansas Medical Society, Dr. L. J. Kosminsky, Texarkana. *Eclectic.* Little Rock, June 6. Sec., Dr. C. H. Young, 1415 Main St., Little Rock.

Delaware: *Examination.* Dover, April 9. *Reciprocity.* Dover, April 16. Sec., Medical Council of Delaware, Dr. J. S. McDaniel, 229 S. State St., Dover.

Florida:* Jacksonville, June 24-25. Sec., Dr. Harold D. Van Schaik, *2736* S.W. Seventh Ave., Miami 36.

Hawaii: Honolulu, July 8-11. Sec., Dr. S. E. Doolittle, 881 S. Hotel St., Honolulu 53.

Idaho: Boise, July 9. Dir., Bureau of Occupational Licenses, Miss Agnes Barnhart, 355 State Capitol Bldg., Boise.

Indiana: Indianapolis, April 25-27. Sec., Board of Medical Registration & Examination, Dr. W. C. Moore, 301 State House, Indianapolis 4.

Maryland: *Homeopathic.* Baltimore, June 18-19. Sec., Dr. J. A. Evans, 612 W. 40th St., Baltimore.

Minnesota:* April 16. Sec., Dr. J. F. Du Bois, 230 Lowry Medical Arts Bldg., St. Paul 2.

Mississippi: June. Asst. Sec., State Board of Health, Dr. R. N. Whitfield, Jackson 113.

Nevada: Carson City, May 6. Sec., Dr. G. H. Ross, 215 N. Carson St., Carson City.

New Jersey: Trenton, June 18-19. Sec., Dr. E. S. Hallinger, 28 W. State St., Trenton.

New Mexico:* Santa Fe, April 8-9. Sec., Dr. LeGrand Ward, 141 Palace Ave., Santa Fe.

New York: Albany, Buffalo, New York and Syracuse, June 24-27. Sec., Dr. Jacob L. Lochner, Education Bldg., Albany.

North Dakota: Grand Forks, July 2-5. Sec., Dr. G. M. Williamson, 4½ S. Third St., Grand Forks.

Oregon:* *Endorsement.* Portland, April 27. *Examination.* Portland, July 24-26. Exec. Sec., Miss Lorienne M. Conlee, 608 Failing Bldg., Portland 4.

Pennsylvania: Philadelphia and Pittsburgh, April. Act. Sec., Bureau of Professional Licensing, Department of Public Instruction, Mrs. M. G. Steiner, 351 Education Building, Harrisburg.

South Carolina: Columbia, June 24-26. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia.

South Dakota:* Pierre, July 16-17. Sec., Medical Licensure, State Board of Health, Dr. Gilbert Cottam, Capitol Bldg., Pierre.

Washington:* Seattle, July 11-12. Sec., Department of Licenses, Miss Nell Adams, Olympia.

Wisconsin:* June 25-27. Sec., Dr. C. A. Dawson, River Falls.

Wyoming: Cheyenne, June 3-4. Sec., Dr. G. M. Anderson, Cheyenne.

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Arkansas: Little Rock, May 1. Sec., Mr. L. E. Gebauer, 701 Main St., Little Rock.

District of Columbia: Washington, April 22-23. Sec., Commission on Licensure, Dr. G. C. Ruhland, 6150 E. Municipal Bldg., Washington 1.

Florida: Gainesville, June 4. Final date for filing application is May 20. Sec. Dr. J. F. Conn, John B. Stetson University, DeLand.

Iowa: Des Moines, April 9. Dir., Division of Licensure & Registration, Mr. H. W. Grefe, Capitol Bldg., Des Moines 19.

Michigan: Ann Arbor and Detroit, May 10-11. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing.

Nebraska: Omaha, May 7-8. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, 1009 State Capitol Bldg., Lincoln 9.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1936 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American Journal of Ophthalmology, Cincinnati

29:1-150 (Jan.) 1946

Persistence and Hyperplasia of Primary Vitreous: Tunica Vasculosa Lentis or Retrolental Fibroplasia. A. B. Reese and F. Payne.—p. 1.
Graduate Training in Ophthalmology: Second Jackson Memorial Lecture. H. S. Gradle.—p. 24.
*Report from the Wilmer Institute on Results Obtained in Treatment of Myopia by Visual Training. A. C. Woods.—p. 28.

Vision in Industry. I. B. Lueck.—p. 63.
Visual Test for Infants. J. N. Evans.—p. 73.
Repeatability of Keratometric Readings. R. E. Bannon and Rita Walsh. —p. 76.

Treatment of Myopia by Visual Training.—A series of 103 myopic persons were selected from a total of 130 applicants. The uncorrected visual acuity of these patients was recorded, a cycloplegic was instilled and the retinoscopic and static refractions were determined. At the end of the visual training the patients were again examined. It was found that 30 of these patients showed a low grade improvement on all charts. This improvement averaged an increase of 27 points in the percentage visual acuity. A second group of 31 patients did not show a consistent improvement on all four charts but did show an overall improvement in both eyes which averaged 14.7 points increase in the percentage visual acuity. The improvement in these two groups was not consistently maintained. A third group of 32 patients did not show any change in the percentage visual acuity. A fourth group of 10 patients showed a decrease in the percentage visual acuity of 10.8 points. The changes in the percentage visual acuity noted was found to lie within the limits of error of subjective testing. It was believed by the examiners that education in the correct interpretation of a blurred visual image was the chief factor in the improvement noted in this group. It was further believed that the exercises produced a beneficial psychologic reaction in certain patients toward their visual handicap. The visual training used on these patients was not of value in the treatment of myopia.

Treatment of Finger Fractures, Simple and Compound: Finger Amputations. G. J. Curry.—p. 80.

Neostigmine Therapy of Disability Following Fractures.—Kabat and Jones report on neostigmine therapy of 51 patients for neuromuscular dysfunction resulting from trauma. Twenty-three of the 51 patients had fractures of the upper extremity, 17 had fractures of the lower extremity, 7 had fractures of the vertebrae and 4 had multiple fractures. Excluding the disabilities which had been present longer than five years, the average duration of the disability was 11.2 months. Of 20 patients who were given daily injections of saline solution for one week as a placebo, only 2 showed improvement. Neostigmine was usually administered for two to three weeks. This treatment resulted in significant improvement in 39 of the 51 patients. Of the remaining 12, 4 showed slight improvement while the other 8 were without improvement. It has been possible to follow 27 of the 39 patients who showed significant improvement from neostigmine therapy for one to eight months after treatment was discontinued. In all except 1 the improvement was retained after cessation of drug administration. The therapeutic value of neostigmine in the treatment of chronic disability following fractures emphasizes the important role of neuromuscular dysfunction in these disabilities.

Effect of Cox Type Vaccine on Louse Borne Typhus.—Ecke and his associates report 61 cases of naturally occurring louse borne typhus in patients who had received, previous to the onset of illness, one or more injections of 1 cc. of ether extracted Cox type yolk sac vaccine equivalent in concentration to 10 per cent yolk sac suspensions of rickettsias of epidemic typhus. The patients who received two or more doses of vaccine twenty-one days or more before the onset of typhus had the mildest course and the shortest febrile period. The only fatality was of a patient who received one dose of vaccine only three days before the onset of illness The vaccine reduced the mortality as well as the severity of naturally acquired typhus as it occurs under conditions which prevail during epidemics The longest interval observed between the last dose of vaccine and the onset of typhus was 325 days Most of the intervals were less than 100 days It is possible that the administration of vaccine during the incubation period of typhus will lessen the severity of illness

Radium in Control of Aerotitis—This combined report is based on studies conducted on flying personnel in the European and Mediterranean theaters of operation by medical officers Aerotitis due to inability to ventilate the middle ear during flight has been a major cause of disability in flying personnel Treatment was based primarily on the elimination of hyperplastic lymphoid tissue in the nasopharynx, which is the most common cause of eustachian tube malfunction Irradiation of such tissue with radium was chosen as the best and most practical method of treatment to remove the mechanical factor which predisposes to aerotitis and to remove tissue that harbors pathogenic organisms which precipitate attacks of nasopharyngitis These infections not only increase the susceptibility of the flier to aerotitis but are responsible for much loss of flying time Of the 6 881 patients selected for treatment only 1,129 were available for observation The following conclusions were reached 1 The use of the nasopharyngeal radium applicator is a safe practical and effective method of irradiating hyperplastic lymphoid tissue in the nasopharynx 2 Irradiation of the nasopharynx causes a regression of lymphoid tissue and improves ability to ventilate the middle ear 3 Irradiation of hyperplastic lymphoid tissue about the eustachian tube orifice is an effective prophylactic measure for aerotitis in flying personnel 4 Radium therapy is an advance in the control of recurrent aerotitis

Herpes Zoster Auris ("Geniculate" Ganglionitis).—O'Neill believes that herpes zoster auris presents itself in several forms, some of which are primarily involvements of the trigeminal, of the second cervical and of the vagal ganglion That the geniculate ganglion, as any cranial sensory ganglion, may also be involved cannot be denied, but that such involvement constantly produces otalgia and aural herpes zoster, with or without facial paralysis, as Hunt has asserted, is not in accordance with clinical data To proclaim that all aural, circumaural and juxta-aural herpes lies in the domain of the geniculate ganglion is an unproved assertion Hunt recognized the possibility of involvement of cranial sensory ganglions other than the geniculate, but such involvement to him was always secondary and subsidiary to geniculate involvement In this connection the author mentions 1 of his cases in which an attack of severe neuritis in the second cervical dermatome was followed by aural zosteriform vesiculation, not in Hunt's original zone of the geniculate ganglion but in the expanded zone of the wandering sensory fibers of the seventh nerve In this case Hunt's explanation is totally unsatisfactory.

O'Neill thinks that until necropsy evidence substantiates more completely than it has Hunt's assumptions that the geniculate ganglion not only sensorily innervates Hunt's primary cone, the concha, the tragus, the antitragus and the auditory canal but also at times the postaural region, the nares and the palate, herpetic involvements of these alleged seventh nerve regressive areas should not be referred to as examples of "Hunt's syndrome." Aural herpes occurs not only in gasserian and cervical ganglionitis but probably also in vagal or glossopharyngeal ganglionitis. Again, otalgia may be a symptom of either cervical, fifth, seventh, ninth or tenth ganglionic infection, and the remaining member of the triad, facial paralysis, is a motor disorder of the seventh nerve, its presence neither proving nor disproving a seventh nerve sensory involvement.

Penicillin in Chronic Suppurative Otitis Media.—Thirty young soldiers, whose average age was 26 and whose chief complaints were draining ears, were treated by Conley with large doses of a sulfonamide followed by penicillin. Many previously had had courses of treatment with penicillin and sulfonamide compounds without improvement. Six presented a history of trauma from artillery concussion, with resultant perforation of the tympanic membrane and infection. The remainder had complications with acute infectious processes. The beta hemolytic type of streptococcus and the hemolytic type of Staphylococcus aureus were isolated in approximately 50 per cent of the cases. The plan was to treat the patients first with sulfadiazine and to follow with penicillin in those not responding. Twenty-eight patients were treated with penicillin. It was found that penicillin therapy was of little help for patients whose chronic suppurative otitis media had proved resistant to sulfonamide compounds. The response of chronic suppurative otitis media to systemic treatment with sulfadiazine followed by 1,000,000 units of penicillin was insignificant. The response of chronic suppurative otitis media to local penicillin therapy was good; 53 per cent of the ears were definitely improved. Granulation tissue and cholesteatoma are not affected by sulfadiazine or penicillin whether administered generally or locally. Emphasis should be placed on antritis and epitympanitis and an attempt made to diagnose these conditions. The best treatment for acute and chronic suppurative otitis media is to prevent their occurrence by the prophylactic use of one or both of the chemical or biologic therapeutic agents.

New Treatment for Postoperative Pulmonary Collapse.—If pulmonary atelectasis or collapse develops, the patient should be placed on the unaffected side in a moderate Trendelenburg position. He should be instructed to cough, with some one holding his abdomen. Striking the patient on the back over the affected lung while encouraging him to cough will often help to dislodge the mucous plug. A new treatment consisting in cocainizing the throat with 5 to 10 per cent cocaine solution has been used in a number of cases, with almost instant cure. The cocaine solution in a cotton ball held in a curved applicator is placed far back in the throat and into the pyriform sinuses as if in preparation for a bronchoscopy. This procedure apparently relaxes the musculature of the bronchial tree enough so that within a few minutes the patient will cough up a large plug of mucus. Use of a small amount of epinephrine in the same cotton pledget will help stimulate the cough reflex. During the next twenty-four hours or more, use of intermittent inhalation of oxygen and carbon dioxide is continued, to keep respirations deep and to attempt to reexpand all bronchioles. Chemotherapy with sulfathiazole or sulfadiazine is begun and continued for twenty-four hours or longer to prevent pneumonia in the congested and airless area. The patient is rolled from one side to another frequently and made to continue to cough and take deep breaths. Cocainization of the throat has cured pulmonary collapse and has avoided the necessity of bronchoscopy.

Electrolyte Changes and Chemotherapy in Experimental Burn and Traumatic Shock.—The sodium, potassium and fluid changes have been studied quantitatively in traumatic shock in mice. The magnitude of these alterations and the high susceptibility of shocked animals to experimentally produced increases of sodium, potassium and fluid changes suggest that their combined effects may be an important factor in the mortality from shock. A high percentage of animals will survive an otherwise fatal burn, trauma or hemorrhage if isotonic solutions or sodium salts in amounts equivalent to 10 to 15 per cent of body weight are administered by any route during the first twenty-four hours. It is believed that current methods of treating shock are inadequate in regard to the quantity of isotonic sodium solution employed.

Gelatin Sponge, A New Hemostatic Substance.—Jenkins and Clarke tried an experiment to determine the behavior of the gelatin sponge in the tissues of animals. It was used without thrombin. Dogs were operated on by aseptic surgical technic. After the abdomen had been opened, incisions were made in the liver, the kidneys and the spleen. The hemorrhage was controlled by packing the moistened gelatin sponge into the incision and holding it in place for about two minutes with ordinary moistened gauze. When the gauze was removed, the gelatin sponge was usually adherent in the incision and the bleeding stopped. Gelatin sponge was also implanted in the omentum and in the rectus muscle near the abdominal incision. The animals were killed at periods varying from two to fifty-six days after the implantation. The experiments demonstrated that gelatin sponge is a bland substance which is slowly absorbed in the tissues over a period of about five weeks. Gelatin sponge was used also in 15 clinical cases in incisions in the liver to obtain specimens for biopsy, on the under surface of the liver after cholecystectomy, on thyroid beds after thyroidectomy, on dermatome donor areas, in laparotomy wounds and on the surface of granulating wounds. Bleeding was controlled and there were no complications which might be attributed to the use of the gelatin sponge. It appears to be useful wherever fibrin foam or oxidized cellulose have been proved to be of value.

Sodium Caprylate for Dermatomycosis of Feet.—Keeney and his associates found that 10 per cent sodium caprylate ointment in vitro completely inhibited the growth of Trichophyton mentagrophytes. It was significantly superior to propionate-propionic acid, 5 and 10 per cent undecylenate-undecylenic acid and one-half and full strength Whitfield's, 10 per cent ammoniated mercury, 5 per cent sulfathiazole and 0.5 per cent tyrothricin ointments. The clinical results obtained with 10 per cent sodium caprylate ointment in the treatment of dermatomycosis of the feet were significantly superior to results previously obtained and reported on by employing either propionate-propionic acid or undecylenate-undecylenic acid ointments. The authors have not observed irritation or sensitization from the daily and protracted use of 10 per cent sodium caprylate ointment. Ten per cent sodium caprylate ointment allays itching and does not sting or burn those areas of skin where the epithelium has been denuded.

Appetite Depressing Drugs in Obesity.—Hawirko and Sprague treated 162 persons for obesity. All were subjected to a physical examination and in a large percentage the basal metabolic rate was determined. The food intake was controlled by prescribing a 1,100 calory diet. Fluid and salt restriction was also advised. Amphetamine (benzedrine) sulfate 5 mg. at 8 a. m. and at 10 a. m. was prescribed for 14 of the group. In order to overcome excitability and insomnia of 6 patients d-amphetamine was substituted. For the subsequent patients d-amphetamine instead of amphetamine was prescribed as the appetite depressing drug. The dose used was 2.5 mg. one hour before each meal. This depressed the appetite sufficiently to enable the patient to follow the diet closely. It also avoided the discouragement and irritability which usually accompany rigid adherence to prolonged use of a low calory diet. When the weight became stationary in spite of strict adherence to treatment the d-amphetamine was increased to 5 mg. before the heaviest meal and eventually to 5 mg. before each meal. The maximum dose used was 15 mg. daily. Most patients whose basal metabolic rate was 0 or lower were given 1 grain (0.06 Gm.) of thyroid daily. Multiple vitamin pills were prescribed for all patients. Eight of the more obese patients were given 2 cc. of salyrgan intravenously at intervals of four days to two weeks. The duration of treatment varied from two to twelve months. Of 162 patients treated only 72 persevered with the treatment for more than two months. The amount of weight lost varied in proportion to the number of pounds the patient was overweight. The average weight loss was 5½ pounds (2.5 Kg.) per month. Two patients were unable to tolerate the d-amphetamine. Salyrgan is a valuable adjunct in the treatment of obesity, especially when there is great water retention. Six failures were observed, that is, they reduced less than 20 per cent of the number of pounds they were overweight. D-amphetamine is a useful appetite depressant drug in the treatment of obesity. It is a dextrorotary optically active isomer of racemic amphetamine (benzedrine).

Benzyl Benzoate Dermatitis and Wool Dermatitis.—In the permanent form of wool dermatitis in the soldier there is usually a history of repeated attacks of skin disease; the lesion is usually a folliculitis involving hairy areas in contact with the uniform. If, after the eruption has cleared in the hospital, the patient is allowed to wear battle dress in the ward, recurrence is early and dramatic. If patch tests are performed, discrete areas of folliculitis are produced. A secondary dermatitis not infrequently occurred following the benzyl benzoate treatment for scabies. It was emphasized that this type of dermatitis cleared on avoidance of wool and persisted under any other form of therapy unless the wearing of wool was interdicted. It was also noted that the skin reaction did not occur if benzyl benzoate treatment was administered on only one occasion but that it tended to supervene if the treatment was repeated within two weeks. When such contact dermatitis appears it should be distinguished from relapse of scabies, and lotio scabei therapy should not be pursued. Repeated application of lotio scabei should be discouraged, as the transient wool sensitivity which results may persist for an indefinite time.

Acute Otitic Barotrauma Resulting from Low Pressure Chamber Tests.—Stewart and his associates, in training airmen in the use of protective equipment and of grading them for relative susceptibility to compression sickness, take them on low pressure "runs" to altitude pressures of from 25,000 to 35,000 feet. It was found that descent in the low pressure chamber at a rate of 1,000 to 2,000 feet per minute results in an erythema of the eardrum in approximately 50 per cent of personnel without any symptoms of otitic barotrauma. Even in cases in which only mild difficulty is experienced in equalizing pressure in the ears the drum usually shows a severe generalized hyperemia, and fluid is sometimes present in the middle ear. Permanent eustachian blockage is the cause of otitic barotrauma in only a small number of cases, but these men should be eliminated from aircrew training as early as possible. The incidence of difficulty in equalizing ear pressure on the first run was higher among 1,086 men suffering from an upper respiratory infection (16.5 per cent) than in 1,096 men without such infection (10.1 per cent). The occurrence of serious difficulty was only slightly higher in those with upper respiratory infections (4.1 per cent) as compared with those free from infection (3.0 per cent). Overemphasis on the dangers of a "head cold" has caused undue apprehension among airmen. There was a progressive decrease in the incidence of otitic barotrauma on four successive low pressure chamber runs, demonstrating the value of training, which is also substantiated by the fact that the incidence of otitic barotrauma was lowest in the aircrew with the most flying experience. Men who had difficulty in performing the Valsalva procedure successfully at ground level had a higher incidence of otitic barotrauma. Dental malocclusion may be a minor factor in increasing difficulty in equalizing ear pressure, but this difficulty can be overcome by training in the proper methods, especially by relaxing the muscles of the jaw and throat while carrying out the Valsalva procedure. Acute otitis media is rarely a complication of otitic barotrauma.

Salt-Poor Albumin in Nephrosis.—Thorn and his associates administered salt-poor concentrated human serum albumin intravenously for periods varying between one and thirty days at a dosage of 50 Gm. a day and a rate of 10 Gm. an hour to a group of 7 patients in several stages of chronic nephritis maintained on a diet adequate in calories, containing 80 to 125 Gm. of protein daily and low in sodium chloride. In patients with edema, low serum proteins and absent to moderate hypertension and nitrogen retention, albumin in this dosage was a safe agent in increasing the serum albumin level and in inducing positive nitrogen balance. The diuretic effect of salt-poor albumin was most striking in the severe nephrotic state with massive edema. Control studies with amino acid mixtures administered by mouth and intravenously and with mercupurin did not yield diuresis under these circumstances. The diureses following albumin proceeded at a constant rate only during the period of administration. Following short periods of therapy (ten days or less) the ability to maintain weight loss was roughly related to the slope and direction of the patient's weight curve on the basal regimen. In the 1 instance of prolonged (thirty day) therapy in nephrosis a previously rapidly ascending weight curve became flat following diuresis of 20 Kg., although the patient was still edematous. In contrast to its effect on nephrotic anasarca, the diuretic effect of salt-poor albumin in the presence of minimal edema was slight. Although control studies showed that both amino acid mixtures in comparable quantities and urea (20 Gm. daily) were likewise ineffective, massive doses of urea (90 Gm. a day), when tolerated, appeared to induce further diuresis and weight loss of a transient character. Albumin administration in the presence of severe hypertension or nitrogen retention and in the absence of edema appeared contraindicated owing to its efficacy in rapidly increasing blood volume beyond the tolerance of the cardiovascular system.

Circulation and Respiration During Fever.—Altschule and his co-workers studied changes in the respiratory and circulatory functions of 8 patients following the intravenous injection of typhoid vaccine. The febrile reaction consisted of 4 phases: (*a*) prodrome, (*b*) chill, (*c*) flush, (*d*) defervescence. Each had distinctive clinical features and, except for the prodrome, each was characterized by physiologic phenomena. The chill phase was characterized by intense vasoconstriction, decreased cardiac output, slowed circulation time, hyperventilation, alkalosis and oliguria. There was an initial hypertension followed by hypotension and, in some experiments, shock. The flush phase was characterized by severe vasodilatation, drenching sweats, increased cardiac output, accelerated circulation time, a lesser degree of hyperventilation, maintained alkalosis, diuresis and in many experiments a sudden fall in blood pressure at the onset of the phase. Defervescence was characterized by a return of all mechanisms toward normal. Lymphatic function was apparently increased in the flush phase. No change in circulating plasma volume occurred during the febrile reaction.

Streptomycin in Human Typhoid Carriers.—Rutstein and his associates selected chronic typhoid carriers as subjects for this study for several reasons: they were as relatively "normal" individuals as could be found in the population of the hospital and, in addition, provided an opportunity to study the effect of streptomycin on the typhoid carrier state. Streptomycin was administered every three hours in a dosage of 75,000 and 150,000 units intramuscularly and 31,250 units orally. Following intramuscular administration of streptomycin approximately 60 to 70 per cent of the drug was excreted in the urine during a twenty-four hour period. Appreciable amounts of the drug were not absorbed from the gastrointestinal tract following repeated administration of capsules containing 31,250 units. Blood concentrations of streptomycin following administration of 75,000 units intramuscularly every three hours ranged from 0 to 6 units per cubic centimeter and when the dose was increased to 15,000 units every three hours, the level rose from 5 to 20 units per cubic centimeter. Certain toxic manifestations were noted. At a dosage level of 75,000 to 150,000 units intramuscularly every three hours, significant bacteriostatic effect on the typhoid bacilli in the stool was not obtained. Following oral administration of 31,250 units every three hours, a definite transitory bacteriostatic effect on the typhoid bacilli in the stool was obtained in 2 of 3 patients.

Putrid Empyema.—Strieder and Lynch found that among the 530 patients with acute empyema treated at Boston City Hospital in seven and a half years there were 90, or 17 per cent, with putrid empyema. The average incidence, however, appears to be from 5 to 10 per cent. Putrid empyema is usually secondary to some type of anaerobic infection of the lung. Most frequently it complicates a lung abscess or a gangrenous (fusospirochetal) pneumonitis, but bronchiectasis and tuberculosis are also listed among the primary diseases. Putrid empyema differs from postpneumonic or other pyogenic empyemas not only in etiology but also in bacteriology, pathology and clinical aspects. Clinically it is characterized when untreated by an acute onset with a rapid severe course and early fatal termination. In many patients the fluid is thin for some time. This characteristic should not be considered a criterion in treatment, for it is frequently noted that stabilization of the mediastinum occurs early in these patients. If the mediasinum is not stabilized, patients can receive the benefits of early and open operation. A review of the 90 cases reported demonstrates the value of early open operation. Zinc peroxide is of distinct value in postoperative treatment. Once the foul odor has disappeared and the hazard of open pneumothorax is in abeyance, these patients may be treated like those with the ordinary pyogenic empyema.

Minimal Pulmonary Tuberculosis.—To determine the factors that could aid an early diagnosis of tuberculosis, studies were made on 200 patients who were admitted to the sanatorium with lesions that were minimal according to the standards of the National Tuberculosis Association. Tuberculosis should be suspected at any age, in any occupation and with any type of social or economic background. Positive contact is not a clear diagnostic indication and was present in only 34 per cent of the patients. Close observation is, however, necessary for contact cases, since the incidence of tuberculous infection among them is high. Eighty-two per cent of patients with minimal tuberculosis had symptoms. This is contrary to the statement that minimal tuberculosis is asymptomatic. Minimal tuberculosis can simulate many other ordinary illnesses. Physical findings are totally unreliable in diagnosis. Only 29 per cent of the patients in this series had rales. Tubercle bacilli were found in 21 per cent of the cases. Concentrates and cultures—and ideally guinea pig inoculation—of sputum and fasting gastric contents are required for an adequate search for tubercle bacilli. The tuberculin test was little used in the diagnosis of these cases. X-ray examination was used for diagnosis in 94 per cent of the cases before admission. This is the only reliable method for early diagnosis of minimal tuberculosis. Films should be taken in every case with symptoms suggestive of tuberculosis, in any illness that may be tuberculosis and periodically in all contact cases. Routine x-ray examinations are required for the entire population.

Treatment of Carcinoma of Cervix.—The study by Garcia and Schlosser is based on 716 unselected cases of carcinoma of the cervix admitted to the Charity Hospital of Louisiana at New Orleans in the four year period that ended March 31, 1942. The absolute three year survival rate for the entire group is 37 per cent. The absolute five year survival rate in a group of 329 cases seen through March 1940 is 28 per cent. X-ray therapy is an essential part of the treatment. Unless particularly favorable circumstances prevail, radium can be expected to control the disease only in the central zone of the pelvis. The two sources of radiation are mutually complementary, and they must be carefully integrated. X-ray therapy is administered first and is calculated to deliver a dose of 3,000 roentgens ± 15 per cent to the lateral edge of the parametria in a period of three weeks. This is followed in a few days by radium therapy, 6,600 roentgens being given to the paracervical region in five days, which requires an exposure of 6,500 to 8,500 milligram hours. The total duration of treatment is thirty to thirty-one days. The three dimensional distribution of the combined irradiation encompasses the main areas of involvement in a dosage range high enough to anticipate control of the disease in a substantial proportion of the cases. The authors conclude that radiation therapy remains the treatment of choice in carcinoma of the cervix in all stages of the disease.

Oral Penicillin.—György and his associates compared the blood levels of penicillin in children after ingestion of aqueous penicillin solution and of buffered penicillin (mixed with sodium citrate). Less irregular, higher and more prolonged blood levels were the rule after administration of buffered penicillin by mouth. In the search for other buffers aluminum hydrate gel was considered as a possible substitute for sodium citrate. The blood levels obtained were higher after ingestion of buffered penicillin than after the ingestion of capsules containing the penicillin-oil-beeswax mixture. Trisodium citrate seemed superior to aluminum hydrate gel. The blood levels obtained after the use of 15,000 units of penicillin given intramuscularly do not differ materially from those observed following the use of 40,000 units of penicillin buffered with trisodium citrate administered by mouth. Given in doses which were approximately three times higher than the customary parenteral doses, penicillin by mouth proved to be therapeutically effective in pneumonia, in upper respiratory infections and their complications, in gonorrhea and in pyogenic cutaneous infections. It appears inadvisable to supplant parenteral with oral penicillin indiscriminately. Parenteral administration still remains the method of choice, at least during the early acute phase, in very sick patients with septicemia or meningitis.

Delimitation of Subcortical Tumors by Electrography.—Walter and Dovey say that, often even after localization of a lesion by neurologic examination, electroencephalography and air replacement, exposure of the cortex may reveal nothing, and the surgeon must resort to needling of the subcortical tissue. To supplement this subjective method, a needle electrode has been made with which the electrical activity of the subcortical structures may be recorded. The needle is used by the surgeon like an ordinary brain needle, except that recordings are made at every centimeter of depth. Differences of consistency can of course still be appreciated. When the electrode enters a tumor, abscess, hematoma or a ventricle, electrical activity becomes minimal. It reappears when the electrode emerges on the far side of a lesion. Electrical exploration in three dimensions can be carried out to establish the limits of the abnormal or aneural zone. The method can be used to supplement conventional methods of identifying and locating subcortical tumors at operation. The presence of a space occupying lesion can be detected by its electrical inactivity. Normal cerebral white matter is identifiable by rhythmic electrical activity of the same type as that found in the cortex. White matter adjacent to a space occupying lesion displays slow delta activity similar to that seen in the cortex in the same condition. The spatial extent of a lesion and the zone indirectly affected by it may be delimited with satisfactory precision.

Intensive Antimony Treatment in Schistosomiasis.—The cases described by Alves and Blair involved men, mostly Africans, with either urinary or intestinal schistosomiasis. They were diagnosed by a cercarial antigen intradermal test. The dose of sodium antimonyl tartrate was 12 mg. per kilogram of body weight. It was found that the total dose could easily be administered in six injections, and these were given at 9 a. m., 12 noon and 3 p. m. on each of two successive days. Since it would be difficult to inject smoothly 2 cc. of fluid in five minutes the injection was made up to 10 cc. with a 5 per cent dextrose saline solution. A vein in the antecubital fossa was chosen and the needle inserted. It was found that the same vein and indeed the same puncture could be used for all six injections. As soon as withdrawal of blood has shown that the needle is in the vein, the exact time is noted and the injection is begun. With the piston moving steadily, the injection is given at the rate of 2 cc. or less per minute. A minimum time of five minutes is taken to complete the injection. This slow and steady injection of the drug is of fundamental importance in the success of the treatment. This multiple syringe technic using sodium antimonyl tartrate was used in 100 cases of schistosomiasis. Viable eggs were not found immediately after treatment or at two months and three months after treatment. In 53 cases followed up for two months the cercarial antigen skin test had become negative in all but 14 cases. Nine of the 14 skin test positive cases were observed for three months, and the test became negative in 6 cases in this period.

Penicillin in Infections of Skin.—Davies and his associates investigated the efficacy of treatment of pyoderma with penicillin as compared with other remedies. Penicillin was in most cases applied as an aqueous spray containing 1,000 Oxford units per cubic centimeter. In one group of patients penicillin spray was administered to the lesions on one side of the body, and the results were compared with those of other remedies applied to the lesions on the opposite side. In a second group of patients all the lesions were sprayed with penicillin and the results compared with a control group receiving other forms of treatment. Lastly, a small group of patients received large doses of penicillin by intramuscular injection (400,000 Oxford units daily). Only in annular (staphylococcic) impetigo was penicillin greatly superior to other remedies. Cases of this disease were few. In seborrheic dermatitis, which was the main type of pyoderma treated, penicillin was not more effective than other remedies. In ecthyma, penicillin compared unfavorably with other remedies. The exudate obtained from the lesions was examined bacteriologically before, during and after treatment. Culture resulted in the isolation of staphylococci or hemolytic streptococci or both in 99.5 per cent of the 200 cases examined. All strains of streptococci (isolated from 97 cases) and the vast majority of the staphylococci (in 182 out of 197 cases) originally isolated from the lesions were sensitive to penicillin. Success or failure of therapy could not be correlated with the flora isolated. In spite of treatment penicillin sensitive organisms were usually recovered from the lesions after three days of treatment. In some cases penicillin resistant staphylococci appeared during treatment, and this phenomenon increased in frequency as treatment was prolonged. The presence of penicillin resistant strains of staphylococci was not the cause of resistance to penicillin treatment, since in many refractory cases sensitive staphylococci were recovered after prolonged spraying as well as after intramuscular therapy. All strains of hemolytic streptococci isolated from the lesions both before and after penicillin treatment were sensitive to penicillin.

Nicotinic Acid Content of Blood.—Carter and O'Brien determined the concentration of nicotinic acid in the blood of 60 persons who appeared to be in normal health. The mean level for whole blood was 438 micrograms per hundred cubic centimeters. The normal range lies within the limits 260 to 573 micrograms per hundred cubic centimeters of blood. Repeated determinations have been made over a period of twenty-six weeks in 2 subjects. It was found that the blood concentration of nicotinic acid is constant over a period of time but is temporarily increased after the administration of large doses of nicotinamide. Prolonged administration of nicotinic acid appears to lead to the attainment of a degree of saturation in the blood which is limited by the ability of the blood cells to fix nicotinic acid as coenzymes. The nicotinic acid concentration in the blood in a variety of pathologic conditions does not greatly differ from normal values. Hyperthyroidism and sprue may be associated with low values. Myeloid leukemia with a high polymorphonuclear count is associated with high nicotinic acid values. Pernicious anemia may give low values, whereas in hypochromic anemia normal values are observed. It is concluded that the concentration of nicotinic acid in the blood does not provide a useful nutritional index.

Untoward Reactions from Blood Transfusions. P. Moureau.—p. 258.

Streptococcic Antifibrinolysin.—Graffar found that the plasma clot in 55 of 58 normal adults was dissolved by cultures of streptococci in less than thirty minutes. The plasma clot in 17 of 26 adult patients convalescing from acute hemolytic streptococcus infections was resistant to the solving effect of cultures of streptococci. This resistance is attributable to the presence of a specific antifibrinolysin. The plasma clot of 15 patients with pneumonia, bronchopneumonia, tuberculosis of the lungs or typhoid was dissolved in less than thirty minutes. The plasma clot of 2 patients with Osler's endocarditis showed a moderate resistance to fibrinolysis. This may be attributed to the rheumatic disease and to the hemolytic streptococcus infection which preceded it rather than to the secondary infection with Streptococcus viridans. Serum of normal persons manifested a moderate but measurable antifibrinolytic activity. Neutralization of the fibrinolysin by the serum is to be considered as a quantitative reaction. The antifibrinolysin of the serum deteriorates when submitted to high temperatures. The antifibrinolysin was destroyed by an exposure to a temperature of 75 C. for one hour. The plasma clot in 14 of 24 newborn babies was resistant to streptococcic fibrinolysis. The level of the antifibrinolysin in the serum of the newborn was close to the level of the serum of the mother. A relationship was not demonstrated between the degree of resistance to fibrinolysis of the plasma clot of the newborn and the antifibrinolytic activity of its serum. The factor which produces the resistance to fibrinolysis in the newborn is therefore not the specific antifibrinolysin, and its nature has not been determined.

Methyl Testosterone in Treatment of Sjögren's Syndrome.—Brückner reports the history of a woman aged 47 who presented Sjögren's syndrome. She had been troubled with keratitis, dryness of the conjunctiva, foreign body sensation in the eyes, burning sensations in the tongue, pharynx and vulva, a cold and dead sensation and lancinating pains in the fingers, cramps in the joints of the feet and dryness in the mouth and nose. Since the woman was in the menopausal age, incretory disturbances were suspected. She was given daily one or two tablets containing 5 mg. of methyl testosterone by lingual administration. The tablet was not swallowed but had to be absorbed by the oral mucous membrane. This medication has suppressed the keratoconjunctivitis sicca as well as the other symptoms of the syndrome for eighteen months. If the medication is interrupted for more than a week, the symptoms recur.

Thromboembolism.—Johansson and Holmdahl conclude that postoperatively early rising and early exercise are at present the only practical measures for the prevention of thromboembolism. Prophylaxis with heparin or dicumarol is still in the experimental stage. Dicumarol is recommended in treatment of manifest thrombosis. In manifest pulmonary embolism, eupaverin, eventually in combination with heparin, is the sovereign agent.

Citric Acid and Phosphatase Tests in Surgical Indications.—Citric acid and phosphatase analyses were made in 200 cases of gallstones and in diseases of the biliary tract. Westerborn finds them valuable adjuncts to the clinical examination in differential diagnosis of hepatitis and mechanical obstruction but not decisive for diagnosis or as indications for surgery. In uncomplicated cases of inflammation or calculi in the gallbladder the tests do not give satisfactory information.

Nonhemolytic Jaundice with Negative Direct van den Bergh Reaction.—Welin states that mild or latent jaundice, intermittent or chronic, with this reaction is relatively common without signs of disturbance in hemopoiesis or chronic indurative liver processes. Hyperbilirubinemia of this kind can occur (1) as a constitutional inadequacy, (2) in ulcers, (3) in other gastrointestinal disorders or (4) as a residue of acute hepatitis. It seems to be a sign of a liver disturbance revealed mainly by reduced ability to eliminate bilirubin, and also by hypercitricemia. Its benign character has been verified by liver biopsies.

Book Notices

Pulmonary Edema and Inflammation: An Analysis of Processes Involved in the Formation and Removal of Pulmonary Transudates and Exudates. By Cecil K. Drinker, M.D., D Sc., Professor of Physiology, School of Public Health, Harvard University, Boston, Mass. The Nathalie Gray Bernard Lectures delivered at the Bowman Gray School of Medicine, Wake Forest College, Winston-Salem, North Carolina, in December 1944, together with a fifth chapter on Artificial Respiration. Harvard University Monographs in Medicine and Public Health [Number 7]. Cloth. Price, $2.50. Pp. 106, with 27 illustrations. Cambridge, Mass.: Harvard University Press; London: Oxford University Press, 1945.

This small monograph is based on a series of lectures describing experimental studies on pulmonary physiology carried out by the author and his associates. However, the bedside application of the findings is stressed with an insight undoubtedly based on Drinker's early clinical training and obvious interest in practical problems. Most of the physiologic studies deal with the influence of various factors on lymph drainage from the lung of the anesthetized dog. It is pointed out that the normal exit of lymph drainage from the lung is quite inadequate, forming a veritable bottle neck, which is often unable to keep pace in terms of removal with a reasonably steady and rapid production of excess tissue fluid. This is one reason why the pulmonary capillaries possess such a distinct vulnerability to edema. Another reason deals with the fact that exudation obviously blocks the entrance of air to the alveoli, which impairs aeration and leads to anoxia. Anoxia itself is a primary cause for increased permeability of pulmonary capillaries; in other words, anoxia begets anoxia, thus forming a vicious circle.

The beneficial influence of respiratory movements on lymph flow is emphasized and exemplified clinically by the deleterious effect of shallow breathing. Deep respirations not only promote lymph flow but clear the finer bronchioles and stimulate the normal respiratory reflex. In this way aeration is increased and the tendency toward anoxia diminished. An added factor is the erect position, which increases vital capacity and thus justifies the present trend toward early ambulation after operation. The physiologic importance of movement is expressed in the statement "Man is never absolutely sure to remain still physically for any length of time unless he is anesthetized or dead."

In a detailed discussion on the therapeutic use of oxygen the obvious but often overlooked point is made that such therapy is clearly ineffective unless the gas reaches the alveoli; in other words, unless something is first done to clear the air passages. More important is the emphasis placed on the early use of oxygen before extensive obstruction has occurred. Morphine, because of its depressant action, should not be given a dyspneic patient unless he is at least in an oxygen tent.

The last portion of the monograph is devoted to a discussion of artificial respiration. The efficacy of simple methods is emphasized. Mouth to mouth insufflation for acute cessation of respiration can always be used at once, thus saving precious time, which is important, as the chances of recovery fall rapidly after the passage of three or four minutes of complete apnea. Simple insufflation, which distends the alveoli, stimulates the normal respiratory reflex and is probably the reason why this method is so effective in most cases. The same stimulus can be obtained with an ordinary simple gas mask as used by anesthetists. These considerations are emphasized by the author at some length, in contrast to the inapplicability and even danger of the various appliances which are recommended for starting respirations which have suddenly ceased. A distinction must be made here, however, in the case of artificial respiration as a substitute for normal breathing in cases of various types of paralysis. This presents quite another problem and the advantages of the Eve procedure, which provides alternate suction and compression on the lungs through the diaphragm by means of a tilting device, are described and the method recommended. For this purpose other types of mechanical respirators are of obvious utility. On the other hand, Drinker underscores his objections to certain machines for the emergency treatment of sudden cessation of respiration as follows: "The medical profession has for years had incessant sales onslaughts of ingenious mechanical engineers who have devised appliances which are enormously attractive mechanically, very expensive, and little regardful of physiological or pathological consequences."

Although a few of the statements made in this monograph may arouse disagreement, it will be read with considerable interest by all those concerned with pulmonary physiology and with the many clinical details in the bedside care of patients with pulmonary disease. It should prove of practical value as a provocative source of information and as a stimulus to the thinking of all practitioners confronted with the problem of treating pulmonary edema.

Facial and Body Prosthesis. By Carl Dame Clarke, Ph.D., Associate Professor of Art as Applied to Medicine, School of Medicine, University of Maryland, Baltimore. Cloth. Price, $5. Pp.. 200, with 75 illustrations. St. Louis: C. V. Mosby Company, 1945.

For those who are interested in prosthesis, this book will undoubtedly be a useful guide. It is one of three books published in this country on the subject, all three of which appeared in 1945. No doubt the war was an added impetus for the publication of these books.

The author in the first chapter discusses prosthesis (moulage prosthesis) in general. He defines its advantages and limitations as compared with plastic surgery and points out where such restorations are most useful. This chapter includes references to some of the most useful materials for reconstruction of noses and ears, such as latex and plastics, with mention of some of the older materials not in use, such as metals and gelatin-glycerin compounds. Chapters II, III, IV and V deal with materials used in the technic of molding and casting, all of which are indirectly related to the problem of prosthesis. Chapter III, on wax molds, appears to be mislabeled, since only the first page out of thirty-three contained in the chapter deals with the subject of wax molds. Chapter VII, on the control of expansion and contraction of rubber casts, contains interesting data on experiments conducted to find means of compensating for the shrinkage of the final prosthesis.

The book contains valuable information regarding the technic of making full facial casts with various types of impression materials. The technic of taking impressions of the head and face with hydrocolloid materials is given in detail. The problem of making prosthetic hands with latex compound is given considerable space, and some of the technical suggestions made should prove valuable for those who are interested in this difficult prosthetic problem. The author's discussion on coloring of the latex prosthetic restoration is useful. He sets forth the basic problems that are encountered in obtaining lifelike skin color and offers methods of accomplishing this. A selected list of pigments and solvents for these pigments is given. The chapter on restoration of cranial defects deals with one method of filling in such defects, namely the preformed bone chip method. The technic of making a suitable mold in which bone chips may be molded to the desired contour before they are inserted under the skin by the surgeon is explained. The chapter on the use of elastic or rubber-like plastic is necessarily short, since use of the material is still in its experimental stage. A fairly complete bibliography is given at the end of each chapter, and the illustrations are clear.

Physical Treatment by Movement, Manipulation and Massage. By James B. Mennell, M.A., M.D., B.C. Fifth edition. Fabrikoid. Price, $7. Pp. 512, with 288 illustrations. Philadelphia: Blakiston Company, 1945.

A considerable number of alterations have been made in this edition. The illustrations are excellent, new ones have been added, and old ones have been omitted. Numerous alterations have been made in the text; for example, the author gives a summary of the treatment of infantile paralysis with physical medicine. Mennell states that the views expressed in these pages are founded on the result of many years of close observation, study and experiment. He modestly continues "It is possible some of my deductious are erroneous, but at least they are capable of being argued and are not merely arbitary." His chapters on massage show the outcome of the actual experience of a medical man who has really studied massage in theory and practice. His classification of the massage movements and his principles have generally been accepted by the Council on Physical Medicine of the American Medical Association. There are a number of chapters on the treatment of recent injuries by mobilization and massage which should interest those treating these injuries as well as the chapters on the treatment of the after-effects of injury, the reeducation of muscle and reeducation in walking. The chapters on backache, excellently illustrated, are taken from the author's monograph "Backache." These chapters give many points on examination and manipulations for backache. The author says that many of the views herein expressed are unorthodox, and many of the views on backache may fit into this class but they should be read and tried by those interested in physical medicine. The volume contains much valuable information and should be available to all physicians interested in physical medicine.

Libro azul médico mexicano, 1945-46. Paper. Price, $6; 30 pesos. Pp. 279. Mexico, D. F., 1945.

After several years in preparation, the first edition of a Mexican "Medical Blue Book" has been issued, containing information on about 1,300 physicians throughout the country and about 275 dentists in Mexico City and Guadalajara. The director of the publication states that all data in the book have been supplied by the physicians and dentists themselves without incurring any obligation whatever on their part, and that all claims as to graduation and licensure have been verified. The directory is arranged geographically by state, city and surname. The information given on each physician or dentist may include his home and office address, telephone numbers, medical school and year of graduation, registration number, specialty, an indication that he has x-ray equipment, his nationality, place and date of birth, foreign languages spoken and special honors conferred on him, such as faculty and civil appointments and memberships in national and special medical societies. Of considerable help to many users of the directory should be the device of printing each surname in capital letters to distinguish it from other parts of the full name and thus minimize the difficulty of correctly addressing those whose names are combinations of the paternal and maternal surnames. The publisher stresses the fact that the work is necessarily incomplete, as only persons whose medical education could be verified have been included in the first edition, and he pledges that "the work will continue and improve as time goes on." It is hoped that future editions will improve to the extent of including an alphabetical index of the physicians and dentists listed. This index should distinguish between physicians and dentists and indicate the state and city in which they are located, so that information on members of the medical profession in Mexico can be easily located even when only their names are known. The value of the book for reference purposes is also somewhat diminished because of the omission of a table of contents, which is needed to make the information more readily accessible, especially in view of the fact that the book does not have adequate headings on each page to guide the reader. As the scope of future editions enlarges, the addition of information on medical schools and hospitals recognized by the profession would also be of assistance to users of the Mexican "Medical Blue Book."

Physical Chemistry of Cells and Tissues. By Rudolf Höber, University of Pennsylvania School of Medicine, Philadelphia, Pa. With the collaboration of David I. Hitchcock, Yale University School of Medicine, Laboratory of Physiology, New Haven, Conn., J. B. Bateman, Mayo Clinic, Rochester, Minn., David R. Goddard, University of Rochester, Biological Laboratories, Rochester, N. Y., and Wallace O. Fenn, University of Rochester School of Medicine and Dentistry, Rochester, N. Y. Fabrikoid. Price, $9. Pp. 676, with 70 illustrations. Philadelphia & Toronto: Blakiston Company, 1945.

The application of physical and physicochemical principles and methods to the study of biologic problems has resulted in many valuable contributions to our understanding of the complex relationships that exist in living cells. In spite of this fact, however, progress has been relatively slow and our knowledge of this field is still fragmentary. One reason for this slow rate of advance is probably the fact that too few of the older investigators are sufficiently well trained in mathematics, physics, chemistry, physical chemistry and biology to plan and carry out significant work in this borderline field. And yet such work will have to be done, in increasing amounts, before we may expect really to understand the complex chemical and physical reactions that take place in living protoplasm. For these reasons the publication of a book like this one by Höber and his collaborators is significant for the future of cellular physiology. By summarizing our knowledge of the physicochemical reactions of living cells it not only calls attention to the advances which have already been made in this field but also serves to suggest, to the careful and critical reader, further lines of investigation which may prove fruitful in the future. Above all, books of this character, by indicating the great possibilities in this field, should stimulate students to master the necessary fundamental sciences so that not only may they be better equipped to read and understand work of this kind but that they may themselves be in a position to do creative work in this highly important field.

This book is divided into eight sections, containing thirty-eight chapters. Section 1, by David I. Hitchcock, deals with selected principles of physical chemistry and includes chapters on diffusion in liquids, reaction velocity and enzyme action, thermodynamics, electromotive force and some properties of aqueous solutions. Section 2, by J. B. Bateman, deals with the physicochemical properties of large molecules and their architectural and functional significance in living matter. Sections 3, 4 and 5, by Rudolf Höber, are concerned with the architecture of protoplasm, the structure and properties of cell surfaces and the influence of some extracellular factors on cellular activity. Section 6, by David R. Goddard, discusses the respiration of cells and tissues. In section 7 Wallace O. Fenn discusses contractility, including a general survey of contractile tissues and of muscles. Finally section 8, by Höber, deals with passive penetration and active transfer in animal and plant tissues and includes chapters on such subjects as intestinal absorption, formation of urine and elaboration of digestive juices. This mere listing of section headings is by itself inadequate so far as indicating the wide variety and scope of the subjects treated in this book is concerned. This is not a book to be read casually, especially by one who does not have the necessary mathematical and physicochemical background. It is a book which, studied carefully, will prove stimulating to students of biology and medicine interested in gaining a better understanding of the structure and properties of living protoplasm and of the complex chemical and physicochemical reactions which help to endow living protoplasm with its unique properties.

The Osseous System: A Handbook of Roentgen Diagnosis. By Vincent W. Archer, M.D., Professor of Roentgenology, University of Virginia Department of Medicine, Charlottesville, Va. Cloth. Price $5.50. Pp. 320, with 148 plates. Chicago: Year Book Publishers, Inc., 1945.

This book recognizes the need for adequate training and experience in radiology before attempting diagnosis by x-ray, but it will be found helpful by practitioners whose work is not confined to that specialty. The book covers examination of the bones for fracture and disease and constantly refers to the normal structures and variations. A new departure is the presentation of diseases of the bone under the pathologic findings instead of under the conventional headings. This appears to be a more direct approach from x-ray examination to diagnosis. The illustrations are carefully correlated with the subject matter and clearly labeled for quick interpretation. The x-ray reproductions are of exceptionally fine quality. Hints and criteria are given for judging the quality of films and for a clear and logical approach to diagnosis. A systematic method for routine examination is presented. Timely warnings of pitfalls to be avoided by the diagnostician are given. This book should be helpful to both the general practitioner and the radiologist.

Doctor! Do Tell! Interesting and Entertaining Human Interest Episodes Which Forty Odd Years in the Field of Medicine and Surgery Have Disclosed. By Dr. Victor F. Marshall. Fabrikoid. Price, $2.50. Pp. 235, with 6 page plates. Appleton, Wisconsin: C. C. Nelson Publishing Company, 1945.

The story of a life is always interesting, especially the story of a long life devoted to serving the sick. That is what Dr. Marshall's autobiography represents. Childhood, medical school and active surgical practice in a Wisconsin town are related in brief sketches, with emphasis on human interest and with a generous admixture of subdued humor. The development of medicine of the last forty-five years is portrayed here as reflected in the practice of a busy surgeon, including sulfonamides and the Rh factor. Some day historians will find in books like this a true picture of medical practice of the period it represents.

Queries and Minor Notes

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards will not be noticed. Every letter must contain the writer's name and address, but these will be omitted on request.

ALTITUDE AND HEART DISEASE

To the Editor:—The wife of a friend of mine who lives in the central part of Mexico (about 6,000 feet above sea level) has been suffering from some sort of heart trouble and has been advised to move to a lower altitude, as it actually has been found that when she comes down to this city, the altitude of which is about 2,000 feet, she really feels better. Would it be possible to improve conditions by constructing a pressure room in order to equalize the barometric pressure by actually pumping air into the patient's room at least during the night hours? It would be necessary, of course, to provide for an outlet for the air that has been let in small enough to maintain the desired pressure. Do you think this experiment would be worth while trying? F. Vela-Gonzalez, M.D., Monterrey, N. L., Mexico.

Answer.—The barometric pressure at 6,000 feet is approximately 609 mm. of mercury, and the calculated oxygen tension in the alveoli is around 75 mm. of mercury. Although it might seem that the fall in the alveolar oxygen tension from the normal of 104 or 105 at sea level to around 75 at 6,000 feet is considerable yet this is responsible for only a slight lowering of arterial oxygen saturation. This is clearly shown by a glance at the oxyhemoglobin dissociation curve of arterial blood; the upper part of the curve tends to flatten out so that at tensions of 75 mm. of mercury the arterial blood may still be 92 to 93 per cent saturated as compared with the normal of around 96 per cent.

Most people with heart disease while at rest do not have a significant lowering of the arterial oxygen saturation; hence a change from sea level to 6,000 feet or the reverse should not be important except during activity. It probably would not be worth while to pressurize the patient's room because in all likelihood little or nothing would be gained. Even assuming that an increase in alveolar oxygen tension is desirable, it would be simpler and far more economical to increase the percentage of oxygen in the inspired air. It should also be emphasized that variables other than barometric pressure might account for the patient's greater feeling of well-being at the lower altitude.

PERSISTING FISTULA AFTER APPENDECTOMY

To the Editor:—A Mexican woman aged 28 had an appendectomy one year ago. She has had a draining abdominal sinus ever since. Smears and culture reveal only Staphylococcus aureus. There is no fecal odor. X-ray examinations of chest and bones are negative for any bony pathologic changes. Chest x-ray examination reveals an old calcified inactive tuberculosis. Neoiopax solution injected through the sinus into the abdomen followed by x-ray examination reveals dye in the intestinal tract. For treatment the patient received 1 million units of penicillin intramuscularly every three hours without effect; that is, 20,000 units every three hours. Staphylococcus vaccine did not help. Local penicillin irrigations have not helped. Her physical condition is good except for a mild secondary anemia. Occasionally she will have a mild fever when drainage slows down. I would appreciate knowing the next step to take; if surgical, would you leave a drain in until the patient is completely well? Would you use the cautery? Is there any treatment besides surgery?

Arthur L. Henrichsen, M.D., Van Nuys, Calif.

Answer.—"A persisting sinus or fecal fistula following appendectomy for acute appendicitis is due to an ulcerative or granulomatous lesion of the region, an abscess cavity, gangrene, constriction of the intestine below the fistula or a foreign body. Fistulas resulting simply from the pressure of drains, misplaced sutures, the nicking of the intestine, inversion of the appendical stump or failure to invert it generally heal spontaneously. Persistence of the fistula is evidence of an inherent lesion of the intestinal wall or a microscopic or a macroscopic foreign substance" (Lichtman, A. L., and McDonald, John R.: *Surg., Gynec. & Obst.* **78**:449 [May] 1944). These foreign bodies include suture material, cotton fibers, talc, petrolatum or lycopodium. Cases have also been described in which adult Ascaris lumbricoides, the ova of Tenia saginata, Endameba histolytica and Actinomyces fungoides were thought to play a part in the formation of fistulas. In cases in which the external opening is small, sinus tracts infected with Escherichia coli can simulate the fecal discharge and can be easily confused with a suppurative saccular fecal fistula in which an abscess cavity is interposed between the internal and the external opening and which discharges fecal or purulent material intermittently.

Spontaneous healing of most postoperative fecal fistulas will occur unless there is a foreign body in the tract, in which event operative removal is essential to a cure (Deaver, J. B.: *Ann. Surg.* **83**:782 [June] 1926. Ray, B. S.: *New York State J. Med.* **38**:412 [March 15] 1938). Some authors have reported spontaneous closure of fistulas as long as seven years after their appearance.

In cases requiring surgical treatment the following procedures are to be considered (Lichtman, A. L., and McDonald, J. R.: *Surg., Gynec. & Obst.* **78**:449 [May] 1944):

1. Extraperitoneal curettage and packing, indicated when a foreign body is suspected and when a little freshening in an epithelial lined tract will promote granulations and closing.

2. Simple extraperitoneal closure. In this procedure the skin around the stoma is freed and the walls of the fistula are dissected away from the abdominal wall. The dissection is carried down to the peritoneum, which is pushed back so that the fistula can be clamped and excised with the knife or cautery. The fistula is excised with a longitudinal incision in the intestinal wall. The mucosa of the intestine is then inverted in a transverse direction with two or three rows of sutures. Five Gm. of sulfathiazole may then be dusted into the area, and the abdominal wall is then closed in layers. A drain may be placed down to the fascia. This method is useful when the fistula is small and thin and the internal opening is small.

3. Intraperitoneal procedures, which include simple repair with excision of the fistula, simple repair with plastic operation on the intestine, side to side anastomosis with or without excision of the fistula, extraperitoneal resection, colostomy or ileostomy. Usually simple tubular fistulas after appendectomy yield good results with simple intraperitoneal closures. Fistulas originating in granulomatous lesions of the ileum, cecum or colon require resection. Greater safety and a cleaner surgical procedure can be secured by the preliminary performance of ileostomy or colostomy in large fecal fistulas.

The choice of a procedure will depend on an accurate preoperative diagnosis of the course and the extent of the fistula and on the findings at the time of operation.

CHRONIC MERCURIALISM

To the Editor:—A patient states that she received mercury poisoning four years ago from inhaling mercury fumes while melting amalgam dental fillings. Would this cause enlargement of the spleen sufficient to give aching in the left upper quadrant? At the present time the spleen shows only a slight enlargement by x-ray. M.D., Georgia.

Answer.—Chronic mercurialism is characterized by fine intention tremor, psychic irritability of an exaggerated degree, dermographia, excessive perspiration and abnormal readiness to blush, exaggerated tendon reflexes, pallor and certain abnormalities of the mouth. Mercury is eliminated in the urine, feces, saliva, sweat, bile and milk. The greater number of authors tend to localize the central nervous system disturbances in the nuclei of the base of the brain; the cerebral cortex also may be affected. Mercury is stored principally in the kidneys, liver, spleen and bones. In the examination of 59 cases of chronic mercurialism in the felt hat industry by Neal and others (Mercurialism and Its Control in the Felt Hat Industry, Public Health Bulletin 263, 1941) and 43 cases of chronic mercurialism in the fur cutting industry (A Study of Chronic Mercurialism in the Hatters' Fur Cutting Industry, Public Health Bulletin 234, 1937), no cases of enlargement of the spleen were found. Therefore it is probable that the enlargement of the spleen in this case, four years after the occurrence of mercury poisoning, is not due to chronic mercurialism.

OVARIAN CYSTS

To the Editor:—It appears to be the custom in our local clinic, during any routine laparotomy, to inspect the ovaries and to puncture with a needle or the point of a scalpel any translucent area, allowing a small amount of yellowish looking fluid to escape. These pockets of fluid on the ovaries are called cysts. Could you discuss the etiology and pathology of these pockets of fluid? M.D., Utah.

Answer.—The majority of the cysts referred to are atretic follicles in various stages of degeneration. Only one out of every hundred follicles develops in the normal manner and goes on to form a typical corpus luteum cyst. The remainder become corpora atretica, and during the process of involution varying amounts of yellow or clear fluid often collect. This fluid possesses estrogenic activity. On section these so-called cysts are lined with theca interna cells, which may be more or less flattened according to the amount of fluid contained. It is the current conception that the formation of these small cysts is a normal one and that puncturing them is not of value. If, however, they are large enough to necessitate removal, excision rather than incision is the method of choice.

UNILATERAL MYDRIASIS

To the Editor:—A man aged 25 had an injury to his left eye seven weeks ago. A small particle of metal was removed from his cornea, and homatropine 5 per cent was used afterward to dilate the pupil. He recovered from his injury, but the pupil remains dilated. Pilocarpine 1 per cent and physostigmine 0.5 per cent will not pull the pupil back to its normal size permanently. The vision is good for far and near in the affected eye. The eye is normal in all other respects. Five years ago both pupils were dilated for refraction and were normal afterward in proper time. The right pupil measures 2 mm. and the left 5 mm. The fundus is normal. The particle removed from the eye was too small to injure the lens. What can be done to bring this pupil back to normal?

S. A. Kleger, M.D., Astoria, Ore.

ANSWER.—An injury sufficient to produce unilateral mydriasis and no paralysis of accommodation must be more severe than in the case described. It must lead to a rupture of the sphincter pupillae or a paralysis of pupillary action because of damage to the nerve endings in the iris. Rarely an intraorbital traumatic lesion that will irritate the ciliary ganglion is encountered. It is more likely that in the case described the dilated pupil is the result of some condition other than that of injury, and one must think of irritation of the cervical sympathetic nerve on the affected side. Such an irritation can be produced by a tuberculous lesion in the apex of the lung or a tumor or scar tissue in the neck that would incarcerate or at least irritate the cervical sympathetic nerve. When the irritation is removed, the pupil will generally return to normal size. It is suggested that a weak solution of pilocarpine nitrate 0.5 per cent used twice a day will be sufficient to keep the pupil reasonably small. However, a thorough investigation should be made of the patient's general condition to determine the cause of the dilated pupil other than the foreign body of the cornea, which was trivial.

CHARTS FOR MAPPING SENSATION

To the Editor:—Will you tell me where I can obtain "sensory charts" to be used in charting sensory disturbances in neurologic disorders?

S. A. W., M.D., Salt Lake City.

ANSWER.—Most of the charts commonly available are quite inaccurate. Many of these are available in the various textbooks of neurology. The most accurate studies of the areas of skin innervated by the various spinal roots and segments have been made by Foerster. An excellent diagrammatic presentation of his findings has been prepared by Lewis. These observations roughly parallel those of Head made several years earlier. Both Head's charts and Lewis's chart after Foerster have been reproduced by Fulton. For the most accurate sensory charts it would be best to have new charts prepared from these. However, charts prepared from the older diagrams can be obtained from the Physicians Record Company of Chicago and doubtless from other publishers of medical forms.

INFRA-RED LAMP TO KEEP CHILD WARM

To the Editor:—A girl baby, aged 10 months, uncovers herself completely every night as soon as she is put to bed, no matter how cold the room. Regardless of how many times she is covered each night she immediately uncovers herself. After trial of many different kinds of models of blankets and garments it was found that the only way to keep the baby warm was to have a small infra-red lamp at a certain distance from her crib connected the whole night. Could this prolonged exposure to the infra-red rays cause any damage to the child?

F. A. Bonaventura, M.D., San Diego, Calif.

ANSWER.—Infra-red rays are merely heat rays. If a therapeutic lamp is used for the purpose described, harmful effects are not to be expected as long as the lamp is kept far enough away from the surface of the child's body to prevent any concentration of intense heat on the surface of the body. Infra-red rays do not possess mysterious or unusual properties. In fact, rays from an ordinary infra-red generator which glows at a dull red heat (600 to 800 C.) do not penetrate so deeply as do the rays from an ordinary tungsten filament bulb. It has been pointed out that the "infra-red coil" used by the physician does not differ from the coil used in the familiar household heater with the exception that the household heaters have a wider reflector shaped somewhat like a soup plate which diffuses the heat through the room, whereas the physician's infra-red lamp has a more concave reflector shaped somewhat like a coffee cup which converges the radiant heat on a small area. Provided the radiation is not concentrated too intensely on one surface of the child's body, no harm should ensue. The only damage which could be done would be burning, which would be perceived instantly by the child and which would cause pain. Since the lamp is already being used without any discomfort to the child, there is no reason to expect that there will be any deleterious effects. The application described merely converts the physician's infra-red lamp into a form of household heater. With due precaution, the same procedure might be recommended in similar cases.

REACTION AFTER THYROIDECTOMY

To the Editor:—A woman aged 48, complaining of a lump in the neck of ten years' duration, a tired feeling most of the time and some difficulty in swallowing, was admitted to the hospital for study. Examination revealed a large nodular goiter in the right side of the neck, moderately advanced graying of the hair and apprehension but otherwise minimal signs of toxicity. The pulse ranged between 80 and 110, and the blood pressure was 160/80. Urine and blood studies were negative with the exception of a mild renal glycosuria, the glucose tolerance test being normal. A chest plate was negative. Basal metabolism tests were plus 45, plus 29 and plus 22 on three successive occasions during the first ten hospital days. Shortly thereafter a subtotal thyroidectomy with removal of a 5 by 4 by 4 cm. nodular area in the right lobe was performed under nitrous oxide and ether anesthesia. Iodine was not used preoperatively. When the patient returned to the ward the pulse rate was 132 and the blood pressure 157/80. By 4 p. m. her temperature was 101.4 F. (rectal). The temperature remained elevated between 100 and 102 F. for the next five days, when it fell to normal and remained there. The pulse rate continued at 130 to 140, and on the second postoperative day auricular fibrillation with an apical rate of 160 commenced. Digitalis was started, though there were no signs of failure. On the next day normal sinus rhythm returned, with a rate of 100, and the digitalis was stopped. Lugol's solution by rectum was started on the first postoperative day. The remainder of the hospital course was unremarkable. The basal metabolic rate on the twelfth postoperative day was plus 1. During the first few days after operation, physical examination of the patient was negative and no cause for the temperature elevation could be found. The patient had no complaints, and the only positive findings were as stated. Did this patient have a mild thyroid crisis or is some other explanation of this episode more likely?

John R. Roberts, M.D., Auburn, N. Y.

ANSWER.—The postoperative reaction described is characteristic of that seen after a subtotal thyroidectomy for toxic goiter. Some rise in temperature postoperatively is the rule, and a rectal temperature of 102 F. for several days is about what would be expected.

The pulse rate was higher than is usually seen, but this fact can be explained by the auricular fibrillation. The onset of auricular fibrillation in the postoperative period in a woman aged 48 with a toxic goiter is not surprising. Auricular fibrillation occurring under these circumstances may be disregarded in the absence of any associated cardiac findings. If the patient is well compensated it should not be regarded seriously.

The fact that the patient felt so well after operation would rule out completely the presence of a mild thyroid crisis. In retrospect it might be said that it would have been well to give iodine preoperatively.

PELVIC MEASUREMENTS AND LABOR

To the Editor:—I should like a statement regarding the possibility of a successful delivery at full term of a patient whose pelvic measurements made by x-ray are given as true conjugate 12, transverse 12, right oblique 11, left oblique 11. The report further states that "The pelvis is rather unusual in shape. The coccyx angles posteriorly."

Ewart S. Sarvis, M.D., Sumas, Wash.

ANSWER.—The inlet measurements of this pelvis are within the range of normal and a normal sized child should have no difficulty in engaging. However, without measurements of the midplane and lower pelvis it is impossible to say what the whole picture of the bony pelvis is. From the fact that the coccyx angles posteriorly it would seem that there was room, at least in the anteroposterior diameter of the midplane. A more complete pelvimetric survey of this pelvis is desirable.

VITAMIN D AND RENAL DAMAGE

To the Editor:—A patient has frequency of urination when taking vitamin D capsules. The capsules were made by a reliable drug firm and the dose was two capsules a day. Does vitamin D produce a diuresis? Is it harmful under these circumstances?

W. J. Klinck, M.D., Lennoxville, Que.

ANSWER.—There is no evidence that vitamin D in ordinary doses (up to 1,500 units a day) causes frequency of urination or renal damage. In doses of 50,000 units or more daily vitamin D may cause renal irritation and eventually tubular degeneration. This is true particularly when the diet contains a large amount of calcium, that is when the patient takes as much as three glasses of milk a day.

MEDICAL PROGRESS AND MEDICAL EDUCATION DURING THE WAR

PERRIN H LONG, M D.
Baltimore

It would be premature to attempt to survey with an air of finality the progress which has been made in medicine during the past five years. Many of the data bearing on this subject are still listed as being in the category of classified information, other data cannot be evaluated critically, and, finally, only the faint outlines of the total impact of the war on medicine are visible at the moment. However, it does appear timely to conduct an initial inquiry into the topic, and this paper, which necessarily is preliminary in nature, will be presented for the purpose of stimulating further thought on and analyses of this subject. In considering the question of "Medical Progress and Medical Education During the War," it is proposed to divide it into two main parts. The first will deal with certain of the scientific advances which were made in medicine during the war. The second will concern itself with the effects of war on the professional qualifications and on the education of doctors and medical students.

ACCELERATION OF RESEARCH

It can be said that one of the first effects of the war was to shift the emphasis in medical investigation to problems concerning the care of the wounded, to the prevention and treatment of infectious diseases and to those physiologic and psychologic problems which arose from placing individuals in exotic environments. With this change in emphasis came also a shift from an individualistic type of research to that conducted by groups of investigators whose activities were directed and coordinated for the common good. This was necessary in order that time might be saved and needless reduplications of effort avoided. In the United States this coordination was effected for the Committee for Medical Research of the Office of Scientific Research and Development by the various committees and boards of the Division of Medical Sciences of the National Research Council working in conjunction with the Board for the Investigation of Epidemic Diseases, U. S. Army, the various civilian, army and naval research laboratories, the Canadian National Research Council and the Medical Research Council, the chemical factories and the flying personnel committees in Great Britain. It was also true that, as time was an important factor and there were many practical questions which had to be answered, research largely was concerned with new applications of existing knowledge rather than with the search for fundamental principles.

It may be said that while an adequate liaison and a satisfactory system for the exchange of technical information was maintained between the civilian agencies, *this was not always true as far as certain military* agencies were concerned. While objections were not made officially to the receipt of classified military medical information by civilian investigators, restrictions were placed on the official exchange of such information. As a direct result, information was withheld which was vital for the proper planning and execution of civilian medical research programs. It must be stated in all fairness that the coordinated research program on malaria was a notable exception to this general policy. A great deal of information covering the professional and research aspects of medicine, surgery, neuropsychiatry, preventive medicine and nutrition, which was embodied in special reports, sanitary reports and essential technical medical data reports, was received from overseas theaters of operations. Certain of the data contained in these reports would have greatly assisted those who were planning research programs. However, it was not until the summer of 1945 that this type of data was made freely available to responsible civilian agencies. The policy of not making such data freely available to accredited civilian investigators created an intellectual vacuum, a situation which would be considered intolerable in any concept of total war.

In any consideration of medical progress during the war, it can be said that the experimental and clinical development by Florey and his associates[1] of Fleming's[2] observations on antibacterial effects of penicillin was outstanding. As the story of penicillin has been dealt with so amply it will not be discussed in this presentation with the exception of saying that due credit must be given to the workers in the Regional Agricultural Laboratory at Peoria, Ill., and to the American pharmaceutical, chemical and distilling industries for their noteworthy performance in producing penicillin in quantities which four years ago would have been thought to be fantastic and unattainable. Their genius for organization and production should receive the highest praise from a grateful people. There can be no doubt of the properties of penicillin in helping to save life and limb, but, as far as its role in the care of the wounded is concerned, it must be considered in con-

---

Read before the Forty Second Annual Congress on Medical Education and Licensure, Chicago, Feb 11, 1946

From the Department of Preventive Medicine, the Johns Hopkins University School of Medicine The cooperation of the chairmen of the following committees of the National Research Council extended cooperation which made the preparation of certain parts of this communication possible the Committees on Industrial Medicine, Sanitary Engineering, Shock, Blood and Blood Substitutes, Tropical Diseases, Aviation Medicine, Armored Fighting Vehicles, Cardiovascular Diseases, Neurological Surgery and Vascular Injuries and the Board for the Coordination of Malarial Studies Helpful suggestions were given by Drs E D. Churchill, J S. Lockwood, James Bordley III and L H. Weed.

junction with other adjuvants to surgical therapy, such as plasma, serum albumin, whole blood and the sulfonamides.

The development of resuscitation therapy for the prevention and treatment of shock and of replacement therapy for the maintenance of the blood in the seriously wounded has been an interesting story. Many of the properties of whole blood, plasma and serum in the prevention and the treatment of shock were well known prior to 1939, and hence the problems at the beginning of the war in respect to these agents were those of efficient utilization and production. On the basis of knowledge and conditions existing in 1940-1941 it was deemed advisable to select dried plasma as the agent of choice for use in the resuscitation of the seriously injured, and the aid of the American Red Cross was enlisted for the procurement of the quantity of blood which was necessary to assure adequate supplies of plasma for the armed forces.

It had been noted by the British in the Middle East in 1941-1942 that the administration of plasma, while being valuable as a first aid measure in combating shock, did not bring about the overall favorable results which were noted following the administration of whole blood to seriously injured casualties. This observation, which was not new, substantiated the British organizational concept of the need for blood transfusion units to provide adequate amounts of whole blood in theaters of operations. The British point of view concerning the need for whole blood was sustained by American experience during the Tunisian campaign early in 1943 and led to the establishment of individual blood banks in hospitals in the North African Theater of Operations. This system was maintained in that theater until January 1944, when, following the arrival of the needed supplies, a central collecting and distributing blood bank was established. This bank, supported by military donors, supplied the needed amounts of whole blood for the remainder of the Italian campaign. Its success, coupled with an awakening realization by the services of the value of whole blood in the treatment of the wounded, led to the development of a program by the middle of 1944 which provided for the shipment by air of large quantities of blood from the United States to the European and Pacific theaters of operations.

Other interesting developments in the field of blood and blood substitutes were the development of serum albumin and fibrin products by Cohn [3] and his associates. Serum albumin was used for the treatment of shock both in the seriously wounded and in the seriously burned. In the wounded, according to the best available observations,[4] 25 Gm. of serum albumin gave results comparable to 1 unit of reconstituted plasma. Theoretically this amount should have been equivalent to 2 units of plasma in the well hydrated patient. It could not be demonstrated however that, except for its small bulk, serum albumin was superior to reconstituted plasma in the treatment of the seriously injured. Serum albumin proved to have its greatest value in the supportive treatment of burns and, because of its osmotic power, especially in those burned patients who had become edematous from the retention of excessive quantities of parenterally administered fluids. Fibrin products were found to be uesful adjuvants in surgery.

Despite the fact that much has been said about the value of sulfonamides in the prevention of all types of infection in wounds during the second world war, the results of carefully controlled studies on this point show that, while serious spreading infections may be controlled by the oral administration of sulfonamides in adequate doses, the development of local wound infection is little influenced by the local or systemic use of these drugs. From army and naval surgeons who have served in overseas theaters of operations, impressions at times glowing, at others damning, have been received concerning the value of sulfonamides in the prevention and treatment of infection in the wounded. However, little controlled factual evidence relative to the value of sulfonamides in the wounded is available. In the North African Theater of Operations, during a period in which certain surgeons were praising the virtues of sulfonamide prophylaxis of wound infection while other surgeons were denying its value, studies made on blood concentrations of the sulfonamides in an adequate sample of wounded (all of whom according to the record were receiving sulfonamides by mouth) showed that 24 per cent had either a trace or no sulfonamide in their blood. In the majority of these patients the concentrations of sulfonamides in the blood were below those which are known to be effective. It is evident from these data that reports concerning the efficacy or lack of efficacy of sulfonamides in the prevention of infection in the wounded must be taken with a grain of salt if not supported by studies of the concentration of sulfonamides in the blood.

The record which has been made in this war by American surgeons in their treatment of the wounded is enviable. To date the record shows that but 4.5 per cent of the wounded have succumbed. This is to be compared with a death rate of 8.26 per cent in wounded American soldiers in the American Expeditionary Forces in the first world war and a 10 per cent death rate which was recorded in wounded German soldiers during the first four years of the present war. This saving of life has been achieved primarily by the skill of American surgeons and their ability to develop rapidly the concepts which were necessary for the intelligent management of the wounded. Few if any of the surgeons had ever experienced the flow of gross trauma which faced them when the battle was on and casualties began to pour in. Their conceptions respecting preoperative, operative and postoperative treatment had to be altered to fit the conditions under which they had to work. Their intellectual flexibility, their ingenuity at improvisation and their constant attention to detail in the care of the wounded provided a great tribute to the system of medical education which developed these surgeons. Their record was not equaled by that made by any other nation.

Important advances were made in the prevention and treatment of disease during the war. One of the interesting advances was concerned with the use of tetanus toxoid in the Army. Ramon [5] and his associates had demonstrated the possibility of immunization against tetanus in the nineteen thirties. In the late summer and fall of 1940 the Medical Department of the Army made repeated attempts to impress the War Department general staff of the value of tetanus toxoid and to introduce its use as a universal practice in the Army. These efforts were rebuffed by the War Department general staff because of the fear of adverse criticism from antivaccination groups if another immunization procedure was added to those already in use. (It is to be noted that in matters of health the Medical Department functions only in an advisory capacity to the general staff.) In the middle of 1941 the general staff reversed its position and authorized the immunization of all personnel in the Army of the United States with tetanus toxoid. Rarely has an immunization procedure been so effective, there being but 3 recorded cases of tetanus in the immunized personnel of the Army during the entire war. Tetanus developed in only 1 battle casualty.

[5] Ramon, G.: Rev. d'immunol. 5: 479, 1939.

Immunization against epidemic typhus proved to be very reliable. The value of this procedure has been overshadowed by the later spectacular use of DDT in controlling civilian epidemics of typhus. In the winter and spring of 1942-1943 typhus was epidemic in North Africa and there were hundreds of thousands of instances of the disease in the civilian population. Among American army personnel who had been immunized and reimmunized with the Cox type of typhus vaccine only 2 mild cases of the disease were recorded in the first four months of 1943, while during the same period in a comparable group of Allied troops in whom vaccination was not initiated until the end of February or the first of March, 1943 a total of 43 cases were recorded, with a case fatality rate of roughly 30 per cent.

In the process of the preparation of serum albumin, gamma globulin was produced in considerable quantities.[5] This fraction of human plasma was found to contain a variety of antibodies[6] and was shown by Stokes, Maris and Gellis[7] to be highly effective in preventing or attenuating measles. Later Stokes and Neefe[8] and Stokes and Gellis[9] demonstrated that gamma globulin, when administered in adequate doses, appeared to protect passively against infectious hepatitis.

Another important advance which was made during the war was the development of a formalized vaccine which conferred a certain degree of immunity against influenza. It was demonstrated[10] during the epidemic of influenza in the fall of 1943 that the administration of a single subcutaneous dose of 1 cc. of the vaccine exerted a definite though not a completely protective effect in vaccinated subjects. The results obtained in these controlled studies were striking enough, however, to warrant a large scale immunization program against influenza to be launched in the Army in 1945. In view of the epidemic prevalence of influenza in the late fall and early winter of 1945, reports of the effect of this program for the prevention of influenza in the Army will be awaited with great interest.

A great deal of information was obtained during the war concerning the prophylactic and suppressive effects of certain drugs against infections. As the result of studies carried out by the Commission on Epidemiological Survey and the Commission on Meningococcal Meningitis of the Army Epidemiological Board it was demonstrated that sulfadiazine in amounts as small as a single dose of 2 Gm. was very effective in eliminating the meningococcus carrier states which existed in individuals at the time the drug was administered. These observations thereby provided a method for interrupting or terminating epidemics of meningococcic meningitis which may prove to be very useful. The effects of sulfadiazine in the prophylaxis of beta hemolytic streptococcic infections was also studied during the war.[11] Here, however, the results were not as happy as in the instance of the meningococcus studies. It was found that, while this type of prophylaxis was effective in eliminating hemolytic streptococci from the throats of many carriers, strains of the organisms which were resistant to sulfadiazine (possibly as the result of the use of the drug in prophylaxis) appeared and produced considerable outbreaks of tonsillitis, pharyngitis and scarlet fever. As a result of these experiences it would seem that sulfonamides should be used with caution in the prophylaxis of hemolytic streptococcic infections. Their use in the control of an epidemic in closed groups would seem justifiable, but until further experience has been gained their use for the prophylaxis of streptococcic infections in the mass appears to be questionable.

As a result of the tactical employment of American troops in certain of the most malarious areas in the world, much has been learned during the war concerning the suppressive effects of quinacrine. It was found that the original plan of administering 0.2 Gm. of quinacrine twice a week was not very effective in suppressing malaria. In certain areas this scheme of administering the drug for suppressive purposes was followed by acute and at times severe toxic reactions (nausea, vomiting, diarrhea and fever) after the third or fourth dose of the drug had been given. Extensive experimental and field studies on the pharmacology and suppressive effects of quinacrine, which were made possible during the war by the development of a fluorometric method[12] for determining the concentration of the drug in the body fluids and tissues, demonstrated not only that the administration of 0.1 Gm. of quinacrine daily produced far fewer acute toxic reactions but that this dosage, if taken conscientiously, produced a high degree of suppression of malaria produced by Plasmodium vivax and a causal prophylactic effect as far as infections produced by Plasmodium falciparum were concerned.

Because of the fact that quinacrine acted only as a suppressive agent against infections produced by P. vivax, extensive investigations were carried out under the auspices of the Board for the Coordination of Malarial Studies. This board was composed of representatives of the Army, Navy, United States Public Health Service, Office of Scientific Research and Development and the National Research Council. In one of the most beautifully coordinated programs which marked scientific endeavor during the war, some fourteen thousand chemical compounds were studied for their antimalarial activities. The pharmacology and toxicology of a large number of these compounds were investigated, and about eighty of them showed promise enough to warrant clinical investigation in human malaria. While no true causal prophylactic was discovered, chloroquine, or 7-chloro-(4 diethylamino-1-methylbutylamino) quinoline, was found to be "an effective suppressive when administered no more frequently than once weekly in a well tolerated dose."

The problem of the environmental control of acute respiratory infections received a considerable amount of attention during the war. It was shown by Robertson[13] and his co-workers of the Commission on Air-Borne Infections that glycol vapors were highly effective in the sterilization of air. In fact, it was found that a concentration of as little as 1 Gm. of triethylene glycol in several hundred million cubic centimeters of air was lethal for the common pathogens of the respiratory tract and also for the virus of influenza. Further studies on this subject demonstrated that it was possible to exert a decided effect on the content of pathogens in the air of hospital wards or barracks by the proper oiling of floors and bed linen. It would appear that the use of these methods for the environmental control of acute respiratory infections may be of considerable value in cutting down the incidence of cross and secondary infections in hospital wards and in relatively closed institutions.

The war focused the attention of those concerned with the prevention of disease on the possibilities for developing newer and more effective insecticides and rodenticides. It can be said without fear of contradiction that the development of dichlorodiphenyltrichloro-methylmethane (DDT) as a personal and environmental insecticide represents one of the most important advances in preventive medicine during this century. Following the demonstration in the North African Theater of Operations by Dr. Fred L. Soper and his group of the value of DDT in a dusting powder for delousing native populations, the use of such a powder for delousing the population in Naples in the winter of 1943-1944 averted a major civilian outbreak of epidemic typhus in Italy. The application of the experience in mass dusting which was gained in Naples to the displaced persons and prisoners of war in central Europe after V-E day not only cut short existing epidemics of typhus among such individuals but also prevented extensive outbreaks of the disease all over Europe. The utilization of the residual effects of DDT sprays has revolutionized practices for the control of flies, mosquitoes and moths in and about dwellings. The value of DDT in the elimination of mosquito larvae has been adequately demonstrated, and it seems not unlikely that as a result of this observation great progress may be made in the control of mosquito borne diseases.

The story of the role of the rat in the spread of disease has been so well described by the late Dr. Zinsser in his book "Rats, Lice and History" that it needs no retelling. The rat, despite all methods so far devised for his extermination, has multiplied until he has become not only highly destructive all over the world but also a constant menace to health. It was not surprising, therefore, that research was initiated at the request of the armed forces for the purpose of finding more effective rodenticides. As a result of investigations made during the past five years two effective agents which may in time supersede all others have been developed. These are alpha-naphthyl-thio-urea, which is called antu, and sodium fluoracetate, or 1080. Both are highly toxic, stable and acceptable to rats, and antu is distinguished by the fact that in rodenticidal doses it is not toxic to most large animals or to human beings. Its effectiveness has been well established in a progressive campaign of deratting which has been carried out in Baltimore for the past two years.

Important advances were made during the war in our understanding of the principles of water sterilization. The investigations of Gordon Fair and his associates of Harvard University have done much to clarify the mode of action of chlorine in the disinfection of water. It is now generally believed that the major disinfecting action of chlorine compounds is more or less proportional to the amount of unionized hypochlorous acid which is released when these compounds are dissolved in water. Further researches demonstrated that, under the conditions such as frequently exist, chlorine compounds were not very satisfactory for the disinfection of water in canteens because the amount of chlorine required for sterilization rendered the water unpalatable. A search was made for compounds suitable for canteen disinfection, and it was found that certain of the triiodides were very effective.

Many notable studies were conducted on the physiologic adjustments which man would have to make in order to remain effective or even alive in the environments in which he was placed. Oxygen masks have been developed which permit trained men to fly at substratosphere altitudes. Pressure suits which permit "pull-outs" in high speed dives and tight spirals have been developed. The study of "bends" and "bubble formation" has contributed much information which is valuable in the selection of certain types of flying personnel, and the prevention of "bends" by preoxygenation. For the first time in our history the science of clothing has been developed, with the result that much is now known about the fundamentals of fabric and their ability to transfer heat and water vapor. Studies of the stresses which the human organism may stand in crash injuries have demonstrated that with proper cockpits or other similar enclosed spaces the body may withstand crash injury in a degree considered impossible prior to the war. Notable studies were made on the factors which govern night vision, with the result that practical methods were developed for improving night vision in specialized personnel. Extensive studies were made on the behavior and acclimatization of man to high and low temperatures. Definite advances have been made in our knowledge of the metabolic changes which occur at extremes of temperature and of the steps which need to be taken to maintain human beings at an effective level under such altered environments. The studies on the determination of salt and water requirements under such conditions have been especially interesting.

Certain advances in the fields of curative medicine were of signal importance. Of necessity the therapeutic developments in respect to penicillin are spotlighted. The clinical effectiveness of this antibiotic in the therapy of staphylococcic infections has been well established, and from the data now at hand one can say that the outlook for patients suffering from subacute bacterial endocarditis has been radically changed by the demonstration of the effectiveness of penicillin in this disease. Our concepts in respect to the treatment of gonorrhea have been revolutionized by penicillin therapy. Indeed, one can hope for the eventual practical elimination of this disease. It would be possible (even though not at the moment probable). Most notable and at the same time surprising was the curative effect of penicillin in practically all forms of human syphilis.[14] While it is too early to evaluate the eventual role of penicillin in the therapy of syphilis, it is fair to say that its use constitutes the greatest advance in this field since the demonstration by Ehrlich of the beneficial effects of arsphenamine. However, a note of caution must be interjected at this point, because for the time being the whole problem of the way to treat syphilis is in a ferment. Recently a leading syphilologist when asked "What is the best way to treat syphilis?" replied rather tartly "I knew definitely which was best until 8 p. m. 30 June 1943, but since then I do not know" (the time reference being to his first knowledge of Mahoney's results with penicillin in syphilis). The newer antibiotic streptomycin,[15] while still in the developmental stage, shows definite promise of being a welcome addition for combating infectious diseases.

[14] Mahoney, J. F.; Arnold, R. C., and Harris, A.: Am. J. Pub. Health 33: 1387, 1943.

The war enormously increased our knowledge of the advantages and shortcomings of quinacrine in the therapy of clinical malaria. Prior to 1942 little was known concerning the pharmacology of quinacrine, and hence therapy with this drug was entirely on an empirical basis. This was well evidenced by the mode of administration of quinacrine in the treatment of malaria with quinine, quinacrine and plasmochin in which after two days of quinine therapy quinacrine in doses of 0.1 Gm. three times a day for five days was started. With what is now known concerning the rapidity of the excretion of quinine and of the plasmodiacidal concentrations of quinacrine, it is clear that under this system of therapy the malarious patient was relatively undertreated for a period of about thirty-six hours after the exhibition of quinacrine. Fortunately the brilliant and rapid development of methods[12] by which the pharmacology of quinacrine could be studied revolutionized the treatment of malaria with this drug and produced a rational method of treatment. Then it was possible for the first time to demonstrate that quinacrine was superior to quinine. It is also noteworthy that in the course of the investigations which have been alluded to before and which resulted in the discovery of the antimalarial properties of chloroquine, or 7-chloro-(4-diethylamino-1-methylbutylamino)quinoline, it was found that this drug would cause "an abrupt termination of the clinical attack of vivax malaria" and would "cure falciparum malaria when administered for only one or two days." Further, more recent investigations tend to show that a member of the 8-aminoquinoline group of compounds, SN 13276, may actually be curative in malaria caused by infection with P. vivax. Thus at the present time we have two drugs, quinacrine and chloroquin, which will cure malignant tertian malaria, and definite hopes that a curative agent for benign tertian malaria is just in the offing.

Another interesting development during the war was the discovery of an antiarsenical, 2,3,dimercaptopronal,[16] to which the name BAL (British Anti-Lewisite) was given. This compound was demonstrated to be an active therapeutic agent against the local and systemic action of certain arsenical war gases and also was found to be of value in the treatment of certain types of arsenical poisonings which occur in civilian populations. It has been shown that the drug is efficacious in the treatment of patients suffering from arsenical dermatitis, arsenical encephalitis and patients who have received overdoses of oxophenarsine hydrochloride (mapharsen). It may be of some value in treating the blood dyscrasias which may occur in the course of arsenical therapy. It is valueless in the treatment of alleged arsphenamine jaundice. Recent preliminary trials also seem to indicate that BAL will be of value in the treatment of mercurial poisonings.

Momentous advances in surgical technics did not stem directly from the war, although a great deal was learned about the surgical management of patients. However, during the war definite advances were made in the surgery of certain types of congenital malformations of the heart and great vessels. Now patency of the ductus arteriosus can be cleared in the vast majority of cases. The "Maladie Blue" does not have the same hopeless outlook as the result of Blalock and Taussig's[17] work, and Craford in Sweden has demonstrated that coarctation of the aorta can be corrected surgically.

After recording the achievements of civilian investigators during the war, it must be stated that a great deal has been added to the sum total of medical knowledge by personnel of the medical and other corps of the armed forces. It was characteristic of the system of medical education which produced them that made medical officers all over the world observe, contemplate and then record the various phenomena of disease. Many of these observations are still contained only in official reports, others are in the process of publication, and some will appear only in historical perspective. It can be said, however, that medical officers have contributed notably to the natural history of disease during the war. They have clarified the epidemiology, etiology and pathology of homologous serum jaundice and infectious hepatitis and have extended our knowledge of the clinical course of these diseases. They have contributed notably to the diagnosis, prevention and treatment of epidemic typhus. Medical officers have provided much that is new concerning the prevention, suppression, clinical course and treatment of malaria. The natural history of schistosomiasis, "scrub typhus" and filariasis and methods for the prevention and treatment of these diseases have been investigated by medical officers. Notable contributions have been made by them in the field of psychiatry. And, while carrying on these studies, medical officers attended the sick so efficiently that the overall fatality rate in admissions for illness was less than 0.1 per cent in World War II. This is to be compared with the fatality rate of 1.68 per cent for admissions for illness which was recorded in the first world war and a case fatality rate of 2.0 per cent for all illness occurring in the wehrmacht during this war through February 1944.

UNFAVORABLE EFFECT ON MEDICAL OFFICERS

It has been fairly easy to outline some of the advances which have been made in the medical sciences during the war because they represent specific and tangible additions to knowledge. It is much more difficult to assess definitely the impact of the war on the professional development of medical officers and on the education of medical students and doctors. It will be necessary in the consideration of this problem to discuss certain aspects of the practice of medicine in the Army.

Three factors limited the type of medical practice encountered in the Army. These were the initial screening of prospective patients, a process designed to eliminate the unfit; the age group of the patients, and the high incidence of injury in patients admitted to army hospitals. The practice of medicine was mainly focused on diagnosis and treatment of acute infections, of psychogenic disturbances and of battle and other injuries. The ordinary neoplastic, degenerative and metabolic diseases and many of the common surgical diseases were rarely seen. An analysis of 17,365 patients who were admitted to the medical service of a general hospital in the North African and Mediterranean theaters shows that malignant disease accounted for 0.07 per cent, blood dyscrasias for 0.08 per cent, metabolic diseases for 0.2 per cent, gastrointestinal diseases for 1.7 per cent, cardiovascular diseases 3.1 per cent, arthritic conditions for 3.7 per cent, dermatoses for 10 per cent, infectious diseases for 26 per cent and neuropsychiatric disturbances for 45 per cent of the admissions during a period of twenty-five months. This analysis demonstrates that during the course of a doctor's tour in the armed forces, even though he was fortunate enough to be in contact with patients, his professional experience and development were generally limited as compared with that which he might have experienced in civilian life. On the other hand, as a result of the global character of the war, many physicians in the armed forces became thoroughly conversant with malaria, the dysenteries, infectious hepatitis, scrub typhus, schistosomiasis, kala azar, filariasis, dengue and sandfly fever, diseases which in their past experience had appeared as clinical rarities or textbook oddities. Surgeons became acquainted with injuries of a type which they had never seen before and which, let us hope, they will never experience again. Medical officers became alert and at times, one might say, almost allergic to the possibility that psychogenic disturbances might be the basis for the patient's complaints. The practice of preventive medicine became a part of the daily routine of thousands of medical officers and for many was practically their sole approach to professional duties. Thus, for the period in which they served in the armed forces, medical officers, if in contact with patients, engaged in a type of practice which of necessity was specialized and which was not, with the exception of their experiences in preventive medicine, infectious diseases, gross trauma and psychogenic disturbances, of a type which normally would serve to fit them for civilian practice.

---

[16] Waters, L. L., and Stock, C.: Science **102**: 601, 1945.

[17] Blalock, A., and Taussig, H. B.: Surgical Treatment of Malformations of Heart in Which There Is Pulmonary Stenosis or Pulmonary Atresia, J. A. M. A. **128**: 189 (May 19) 1945.

The organization of the Army is such that many medical officers had little opportunity to enjoy prolonged professional contact with patients during the war. This was especially true for battalion and regimental medical officers and, under certain conditions, for flight surgeons. For these officers the epitome of medical practice was often the holding of sick call and, when conditions were especially propitious, the attendance on the minor sick "in quarters" or in aid stations. Practically their entire time and thought were devoted to the prevention of disease. Their contacts with other medical officers were occasional, medical literature in the form of regularly appearing journals did not reach them, and frequently even such advice and counsel as was contained in the professional circular letters of theater or army surgeons did not filter down to their echelon. The same was essentially true for the medical officers in collecting companies. In the clearing companies of divisions and separate medical battalions, conditions were better. These units were better equipped for the practice of medicine, and during periods of relative inactivity or of rest it was possible for clearing companies to hold most of the minor sick or injured from their divisions. This meant that the medical officers in these units had a minor speaking acquaintance with the practice of medicine.

It can be said that, as a rule, in hospitals of all types there was at one time or another a chance for the assigned medical officers to practice medicine or surgery. The term "one time or another" was used purposely because the professional training of many medical officers in hospital units was frequently not utilized for long periods of time when their units were in "training" or were "staging." It is not within the scope of this presentation to discuss the wisdom of "training" programs or the problems of "staging." This subject has been mentioned only to show that, from the professional point of view, medical officers were often inactive and out of touch with patients.

It is recognized that from the educational point of view it is necessary for physicians to follow their patients from the beginning to the end of their illness if medical and surgical skill is to be developed. It is also true that interruptions of the course of treatment are not beneficial to patients. One of the great, though at times necessary, interferences in the practice of rational medicine or surgery in an overseas theater of operations during the war was the movement of patients from the front to the rear and from one hospital to another. This meant that, as far as the majority of patients were concerned, the medical officer responsible for initial definitive treatment never knew just what happened to his patients. This was especially true of battle casualties. Figures from the Fifth Army indicate that, during the campaigns in Italy during 1944, 78 per cent of the wounded were evacuated to the base section. Thus, surgeons in the auxiliary surgical groups and the field or evacuation hospitals who were responsible for the primary surgical therapy of these patients had little personal chance of knowing whether their initial decisions and actions in respect to therapy were correct. They generally received such information second hand from the base. To a lesser degree this same state of affairs existed in respect to the sick, with the result that physicians knew little of the eventual disposition of many of their patients.

Despite the difficulties which have been mentioned, the horizon of certain medical officers was enlarged by the war. For the surgeon, experience in wound surgery (if not too long continued) was not only a traditional but also a vital phase of his total training. The early education of a surgeon is in character of an apprenticeship which may lead to a provincial and dogmatic point of view. The sharing and pooling of surgical experience and the contact with other schools of surgical thought which marked the practice of surgery in a properly supervised theater of operations exerted a broadening influence on the intellectual growth of surgeons. The same was true for physicians, although in a lesser degree, because the practice of internal medicine is less subject to dogmatism and lends itself more to the standardization of its technics. The physician benefited from his exposure to exotic diseases, but his experience with such diseases cannot be considered as being vital in his total development.

It seems proper at this point to consider the fact that more than half of the practicing physicians in this country came under the prolonged control of administrators in the course of their service in the armed forces.

This experience came at a time when doctors in this country stood on the threshold of a social structure whose protagonists desired in one way or another to organize the medical profession into groups rather than to permit it to continue in its individualistic course. A prolonged experience in the armed forces, in which administration is definitely (and to be fair, necessarily) in the saddle, can be expected to leave indelible imprints. This seems to be particularly true because the administration embodied those undesirable attributes which are opposed in the peacetime practice of medicine. The reference is of course to those limitations in outlook and perspective which led to the tardy recognition of and inadequate concessions to professional needs.

The impact of this experience with administrators may not be apparent at once, as this group of doctors is being dispersed and is at present inarticulate. Also this is essentially a junior group, and it is returning to a junior rank in the hierarchy of American medicine. The full effects of this experience and the nature of the lesson learned will be apparent only in the maturity of these individuals and in their group judgments and actions in the years to come. It may have been fortuitous, as has been said, "for the profession, poised at the 'crossroads,' to have sent a large task force down the road where inefficient administrative control was rampant and three years later to have it rejoin the main force as seasoned (if disillusioned) troops."

DEFICIENCY IN TOTAL MEDICAL EDUCATION

The time is not ripe to state with any degree of finality what the impact of the war has been on the education of medical students in this country during the past four years. However, it seems possible at this time to discuss the effects of the war on certain aspects of medical education.

There can be little doubt that the faculties of the schools of medicine in this country were denuded by the armed forces. A survey of the teaching staff of the Johns Hopkins University Medical School in 1944-1945 shows that, roughly, 28 per cent of this staff were on leave of absence in the armed or other forces of the country. A further analysis shows that 35 per cent of the members of the "full time" or the senior teaching staffs were on leave of absence. In addition, seventeen of the members of the staff in the grades of professor or associate professor were on national committees or in consultant capacities having to do with the maintenance of the health of the nation or of the armed forces. As most of these committees were active, it meant that much time had to be spent away from normal academic duties. Then, on top of all this, the patient burden both in the Johns Hopkins Hospital and in private practice in Baltimore increased considerably during the war years. It is obvious from these statements that the net result was more to do, with fewer to do it. This situation was paralleled in all medical schools and hospitals in the country. It is impossible to evaluate the effects of the program for the acceleration of premedical and medical education, because it was carried out during a period in which it was impossible to control those other factors which are involved in medical teaching. However, if previous concepts in medical education were correct, the decrease in the time spent in premedical preparation, and the lack of opportunity for individual research or contemplation which marked this program in medical schools, were undesirable features.

The modern medical student finally fits himself for the practice of medicine during his period of residence on the house staff of a hospital. It would appear that our medical educational system has suffered most in respect to the training of interns and residents. To begin with, the majority of medical graduates, if physically fit, during the war received but nine months of training and, at the most, twenty-seven months. While intern staffs were not too seriously depleted, there can be little doubt that assistant residencies and residencies were cut to the bone. This meant that a decidedly increased patient load was thrown on intern and resident staffs at a time when such staffs were least prepared to assume such a burden. The result was that the resident staffs of hospitals were primarily concerned with the technics of patient care and with the movement of patients through the hospitals, and there was little time left to them for the study and contemplation of their patients. This, coupled with the diminished number of senior physicians who ordinarily counsel and teach the house staff, meant that the standards for the training of interns and residents fell appreciably during the war. It would seem that this failure in the training of interns and residents constitutes the most serious defect which developed in medical education during the war. Three classes of interns have graduated who have had but nine months of training and that under conditions which were distinctly substandard. In addition, because of their age and physical fitness, it is more than likely that when these interns entered the armed forces their assignments were to posts of battalion surgeon or their equivalent. It has been already shown that the opportunities for advancing a physician's professional education are distinctly limited in such a position. It is therefore quite clear that a heavy responsibility rests on the medical departments of both the Army and the Navy in respect to providing further hospital training for medical officers who have had but nine months of internship. Experience in the North African and Mediterranean theaters of operations demonstrated beyond question that a period of twelve or more months of field service for medical officers produced a type of professional stagnation for which months of rehabilitation in actual hospital work were required before the confidence and professional skill of medical officers returned. If this was the experience with medical officers, of whom many had had long years of training, it is not difficult to imagine what may happen in the group of medical officers who have had only nine to twelve months of hospital training, if they are removed from the practice of medicine for too long a time. It was demonstrated in the North African and Mediterranean theaters that it was possible to prevent the professional stagnation of medical officers by rotating them from the field to hospitals for duty. It is to be hoped for the future of medical practice in this country that the medical departments of the Army and Navy both at home and overseas contemplate a program of this type for the temporary medical officers who will be in service for the next few years. It must not be forgotten that just as great a responsibility for the professional rehabilitation of these medical officers rests on the civilian profession as on the medical departments of the armed forces.

In closing, consideration must be given to the possible implications of the recent directive from the Procurement and Assignment Service which dealt with the reconversion of the 9-9-9 program. The aims of this directive are to provide the armed forces (primarily the Army) with the needed numbers of physician replacements for 1946, to increase the number of residencies which will be available for physician veterans and to lengthen the period of internships to the traditional twelve months. To accomplish these ends the directive makes all physically fit nonveteran interns and residents liable for service in the armed forces by July 1, 1946. The immediate intent of this directive is admirable, but it is necessary to consider its possible effects on research and on the practice of medicine in the United States. The high standards of medical practice which have increasingly characterized American medicine during the past twenty-five years were not achieved by chance. They were the direct result of a calculated program for the continuous education of the young physician. The selection of the bulk of the young medical men in this country for service in the armed forces interrupts this program and transfers these individuals to the relatively limited and often sterile fields of military medicine at a time in their careers when their seeds of productivity in medical research normally begin to sprout. It remains to be seen whether these seeds will maintain their vigor or will die in the barren soil in which, by necessity, they frequently must be sown. If their vigor is to be maintained, these young men must be returned to the laboratories and clinics of this country within a reasonable period. Otherwise the present standards of American medicine will be compromised.

CONCLUSIONS

1. It seems reasonable to conclude that research and the results achieved therefrom were greatly accelerated during the war in such specialized fields as preventive medicine, the treatment of infections, aviation medicine, the management of surgical and psychiatric emergencies and the control or elimination of insect pests. It would appear that research has languished in the fields of neoplastic disease, endocrinologic disturbances, metabolic diseases and degenerative diseases during the past five years.

2. It is concluded, as far as the continuing professional education of the medical officer was concerned, that the general effect of the war was unfavorable.

3. The impact of a system of medical practice in which administrators were firmly in the saddle has undoubtedly left its imprint on more than half of the active doctors in the United States. It is too early to predict what the final reactions of the doctors toward administrative systems of medicine will be.

4. While it cannot be stated that medical education was substandard during the war, it seems certain that the student's total medical education before entering the armed forces has been deficient since 1943.

5. The present policy of making all physically fit medical graduates liable for military service after the completion of a twelve months internship will endanger the existing standards of medical practice in this country if these young men are held too long in the services.

6. A continuing program of professional rehabilitation must be provided for physician veterans. The medical departments of the Army and Navy and civilian medical schools and hospitals share a joint responsibility for the maintenance of this program.

PROCAINE INTRAVENOUSLY IN TREATMENT OF DELAYED SERUM SICKNESS

DAVID STATE, M.D.
and
OWEN H. WANGENSTEEN, M.D.
Minneapolis

In the course of exploring the possibility of employing crystallized bovine albumin (Cohn) as a blood substitute, instances of delayed serum sickness characterized by myalgia, arthralgia, urticaria, petechial rash and fever occurring ten to twenty-one days after injection was noted in [illegible] per cent of the patients injected. [illegible] agents such as epinephrine, ephedrine, codeine and calcium gluconate, although helpful in the mild cases, afforded no relief in the more severe reactions. The generalized myalgia and arthralgia in some cases were especially severe, and it was primarily to relieve distressing pain that intravenous procaine was given. However, the subsidence of all the manifestations of serum sickness was a pleasant surprise and occurred with such frequency as to encourage its employment in all subsequent instances of serum sickness.

Furthermore, we have attempted to explore its utility in the management of other states of hypersensitivity. A series of preliminary reports have been made on these data in a series of progress reports to the National Research Council, Committee on Medical Research, Office of Scientific Research and Development.[1]

PREVIOUS EMPLOYMENT OF INJECTIONS OF PROCAINE DIRECTLY INTO THE BLOOD STREAM

Procaine was first synthetized by Einhorn[2] in 1905. It soon became and has remained the most widely used of all local anesthetics. Although practically all studies are related to its use by local injection, still Bier[3] in 1909 anesthetized limbs by injecting procaine into the veins after rendering the part bloodless and applying a tourniquet to prevent toxic doses of the drug from reaching the remainder of the body. Goyanes[4] in 1912 anesthetized limbs in a similar fashion but injected the procaine into the artery instead of the vein. Lundy[5] used procaine intravenously for the relief of intractable jaundice. He observed that 20 cc. of 0.1 per cent solution was tolerated without difficulty and that relief from itching lasted for several hours after the injection. Leriche[6] gave intravenous injections of procaine for a wide variety of vasomotor disturbances, including acrocyanosis, Raynaud's disease, chronic varicose ulcers, posttraumatic vasomotor disturbances and painful amputation stumps, with good results. He believes that

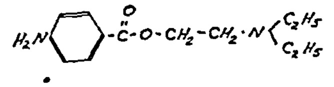
procaine produces a widespread vasodilatation by the direct action on the endothelium of arterioles and capillaries. Gordon [7] used procaine intravenously with satisfaction on human beings to abolish the pain associated with the dressing of large burned areas. Breton and Gedoux [8] found that in doses of 1 mg. per 10 Kg. of weight intravenous procaine was able to prevent and combat drug idiosyncrasies but failed to prevent or combat the manifestations of anaphylactic shock in animals and serum sickness in man.

PHARMACOLOGY

Procaine is an ester of beta diethyl amino ethanol with the formula



It is employed usually as a hydrochloride salt and in this form is a crystalline powder, water soluble and thermostable. It is about one fourth as toxic as cocaine after intravenous or subcutaneous administration. It is readily destroyed in the body primarily by the liver, but some also is excreted unchanged in the urine. Like cocaine it affects all living tissue cells, but its main local action is on the nerve fibers, where it causes rapid attenuation and disappearance of nerve condition. Harvey [9] has also shown a curare-like action of procaine in the myoneural function by reducing the amount of acetylcholine produced as well as depressing the acetylcholine that is liberated.

Summary of Results of Procaine Injections

	Serum Sickness						
Results	Delayed Serum Sickness Following Bovine Albumin Injection	Immediate Reaction Following Bovine Albumin Injection	Delayed Serum Sickness After Antitetanus Serum	Specific Urticaria	Nonspecific Urticaria	Chronic Arthritis	Asthma
Complete and permanent relief	10	0	1	0	0	0	0
Partial and temporary relief	4	1	0	2	4	0	0
No relief	2	0	0	0	1	1	1
Total	16	1	1	2	5	1	1
				27			

Like cocaine, but to a lesser degree, procaine has the property of potentiating the responses of sympathetically innervated organs to epinephrine, sympathin and to sympathetic nerve stimulation.

In a review of the fatalities attending the use of local anesthesia, Mayer [10] found only two deaths attributable to procaine. In 1 case, that of a young man, 2½ grains (0.16 Gm.) of procaine as a 0.5 per cent solution with 1/15 mg. of epinephrine had been injected locally about the tonsils. After the removal of one tonsil the patient suddenly collapsed and died. Autopsy revealed the presence of status thymolymphaticus. The other patient, a boy aged 3 years with extensive burns, had a small amount of procaine (amount not stated) as a 0.5 per cent solution injected subcutaneously, and he suddenly developed cyanosis and convulsions and died. Whether the epinephrine was given also was not stated.

Minor reactions also occur characterized by stimulation of the central nervous system. However, in practically all instances epinephrine is injected subcutaneously, and how many of these reactions might be attributable to the latter is not definitely known.[11]

METHOD OF ADMINISTRATION

One Gm. of procaine diluted with 500 cc. of isotonic solution of sodium chloride was given intravenously by the gravity drip method at a height of approximately 4 feet above the bed level over a period of two hours. If given at a more rapid rate than this the patients often complained of flushing, dizziness and generalized numbness. All patients were carefully watched for signs of procaine sensitivity, and a syringe containing amytal for intravenous administration was available at the bedside to control any sensitivity symptoms should they arise.

OBSERVATIONS

In all, 27 patients were injected intravenously without any evidence of procaine reactions. Of this group 16 were treated for serum sickness following the injection of bovine albumin solution, 1 for an immediate anaphylactoid reaction following the administration of bovine albumin, 1 for serum sickness following the injection of antitetanus serum, 7 for urticaria due to known or unknown sensitizing agents and 1 each for chronic asthma and rheumatoid arthritis.

DELAYED SERUM SICKNESS FOLLOWING INJECTION OF BOVINE ALBUMIN SOLUTIONS

Of the 16 patients treated, 10 obtained immediate and complete relief after one or more injections of procaine. An additional 4 obtained only temporary or partial relief, and 2 were not benefited at all.

REPORT OF CASES

Case 1.—M. E., a white youth aged 19 years, under treatment for repair of ulnar and median nerve injuries, received 25 Gm. of bovine albumin solution ABC_{20} (Cohn) on May 18, 1944 without immediate reactions. On May 30 he developed headache, *anorexia and cervical lymphadenopathy* and on the following day a rash on his feet and legs. He was admitted to the University Hospitals on June 2, where examination revealed that he was seriously ill, with a temperature of 102 F., a maculopapular rash on the feet and legs, and generalized lymphadenopathy. On June 3 the rash extended to cover the abdomen, chest and upper extremities. On June 5 the maculopapular rash disappeared from the feet, arms and abdomen, but a purpuric rash was noted over the back. He also developed a bloody diarrhea and a fall in blood pressure to 80/60 mm. of mercury, necessitating the transfusion of 500 cc. of blood. Under symptomatic treatment the patient gradually improved, but the myalgia, arthralgia and fever persisted. He was given 1 Gm. of procaine in 500 cc. of saline solution intravenously on June 12 with complete and permanent relief of his residual symptoms.

CASE 2.—O. H., a white man aged 62 with carcinoma of the stomach, received 25 Gm. of bovine albumin solution ACB₃₇ on June 16, 1944 without immediate reactions. On July 8 he developed arthralgia and a petechial rash on the chest, abdomen and extremities. The temperature ranged up to 104 F. daily. On July 8 he received 1 Gm. of procaine in 500 cc. of saline solution intravenously in three hours, with complete subsidence of fever, rash and joint pains in twenty-four hours (chart 1).

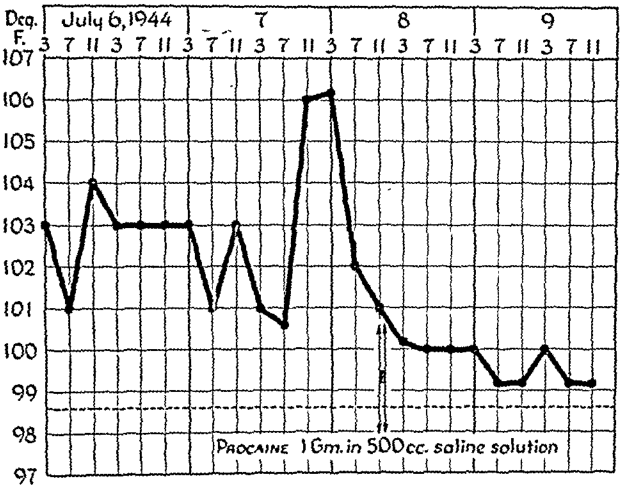

Chart 1 (case 2).—Effect of procaine on fever associated with delayed serum sickness following injection of bovine albumin.

CASE 3.—N. R., a white woman aged 61 with a roentgen ray burn of the sacrum, received 25 Gm. of bovine albumin solution ACB₁₁ on July 29, 1944 without immediate reactions. On August 4 she developed generalized urticaria, itching and a temperature of 102 F. On August 5 the temperature had returned to normal but the urticaria and intense itching persisted. On August 8 she received 1 Gm. of procaine in 500 cc. of saline solution intravenously in approximately three hours, with complete and permanent relief of the rash and itching attending the completion of the administration of the procaine solution.

CASE 4.—A. A., a white man aged 70 with carcinoma of the scalp, received 25 Gm. of bovine albumin solution ACB₃₇ on July 12, 1944 without immediate reactions. On August 5 he developed petechiae about the ankles but no other manifestations of delayed serum sickness such as arthralgia, myalgia, or adenopathy. The temperature of 102 F. could well be explained on the basis of infection beneath the skin grafts on the scalp. On August 9 he was given 1 Gm. of procaine in 500 cc. of saline solution without effect on the rash or fever. Precipitin tests on the patient's serum by Dr. C. A. Janeway at Boston, however, indicated that the patient had delayed serum sickness.

CASE 5.—M. T., a white girl aged 18 years with residual empyema following lobectomy for bronchiectasis, received 25 Gm. of bovine albumin solution ACB₁₁ on Aug. 3, 1944 without immediate reactions. On August 15 she developed myalgia, arthralgia, chills and fever up to 102 F. The serum sickness lasted approximately two weeks. On August 23 she received 1 Gm. of procaine in 500 cc. of saline solution intravenously with temporary relief of the pain in the joints, but subsequent injections of similar amounts of procaine on the 24th and 25th were without effect.

CASE 6.—H. O., a white man aged 33 with healing second and third degree burns of the face, received 25 Gm. of bovine albumin solution ACB₁₁ on Oct. 18, 1944 without immediate reactions. On November 6 he developed sore throat, arthralgia, nausea, vomiting and diffuse urticaria with itching. His daily temperature ranged up to 102 F. On November 10 he was given 1 Gm. of procaine in 500 cc. of saline solution intravenously, with subsidence of all signs and symptoms of delayed serum sickness.

CASE 7.—E. L., a white woman aged 44 with chronic cholecystitis, received 25 Gm. of bovine albumin solution ACB₁₁ intravenously on Dec. 22, 1944 without immediate reactions. On Jan. 9, 1945 she developed myalgia, arthralgia, general malaise, anorexia and a purpuric rash over both tibial regions. She was given 1 Gm. of procaine in 500 cc. of saline solution intravenously on January 17 and 18 with only partial and temporary relief of symptoms.

CASE 8.—P. M., a white woman aged 20 with acute appendicitis, received 25 Gm. of bovine albumin ACB₁₁ on Jan. 2, 1945 without immediate reactions. On January 17 she developed anorexia, joint pains and fever ranging up to 101 F. She was given 1 Gm. of procaine in 500 cc. of saline solution on the 19th and again on the 20th with temporary relief of joint pains for several hours after each injection. The anorexia and fever, however, were not influenced by the procaine.

CASE 9.—A. B., a white woman aged 64, who had sustained a supracondylar fracture of the left femur, received 25 Gm. of bovine albumin solution ACB₁₁ on Dec. 23, 1944 without immediate reactions. On Jan. 13, 1945 she developed myalgia, arthralgia and fever ranging up to 101 F. She was given 1 Gm. of procaine in 500 cc. of saline solution on the 14th, with complete relief of symptoms.

CASE 10.—J. A., a white man aged 51 with squamous cell carcinoma of the left foot, received 25 Gm. of bovine albumin solution ACB₁₁ on Jan. 10, 1945 without immediate reactions. On January 30 he developed pain and swelling of the wrists, shoulders, knees and ankles. A generalized urticaria and petechial rash also appeared. He received 1 Gm. of procaine in 500 cc. of saline solution, with prompt but temporary relief of the arthralgia. A second injection of procaine was given on January 31 with complete disappearance of joint pains and swelling. The rash, however, persisted for three more days and disappeared spontaneously.

CASE 11.—J. C., a white woman aged 49 with carcinoma of the right breast, received 25 Gm. of bovine albumin solution ACB₁₁ on Jan. 29, 1945 without immediate reactions. On February 14 she complained of generalized joint and muscle pains accompanied by swelling of the right wrist and elbow. She was given 1 Gm. of procaine in 500 cc. of saline solution, with prompt and complete relief of symptoms.

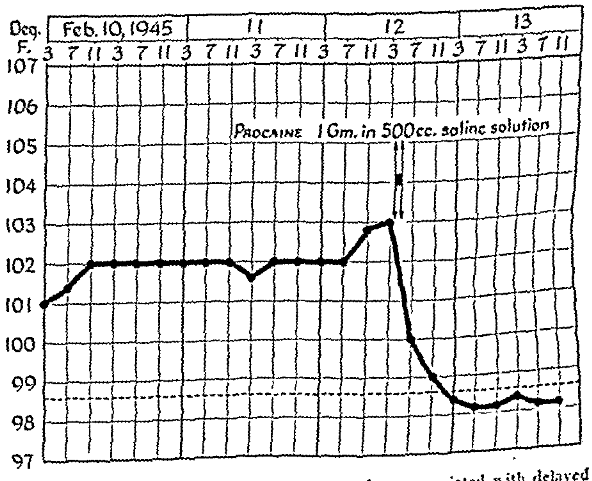

Chart 2 (case 13).—Effect of procaine on fever associated with delayed serum sickness following injection of bovine albumin.

CASE 12.—A. V., a white woman aged 46, who had sustained a simple fracture of the right tibia and fibula, received an injection of 25 Gm. of bovine albumin solution ACB₁₁ without immediate reactions. On February 20 she developed generalized myalgia and arthralgia, and her temperature rose to 102 F. These signs and symptoms persisted for three days, and then

1 Gm. of procaine in 500 cc. of saline solution was given intravenously, with gratifying relief of myalgia and arthralgia at the completion of the procaine injection. Her temperature also subsided from 101.8 F. prior to the injection to 99.8 F. at the termination of its administration.

Case 13.—O. W., a white man aged 59 with postoperative strangulated hernia, on Feb. 5, 1945 received 25 Gm. of bovine albumin solution ACB$_{61}$ without immediate reactions. On February 10 he developed generalized joint pains, myalgia and fever ranging up to 102 F. He was given 1 Gm. of procaine in 500 cc. of saline solution intravenously, with complete subsidence of signs and symptoms (chart 2).

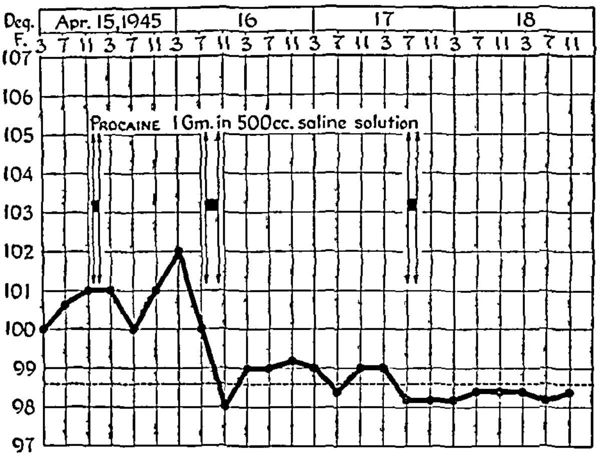

Chart 3 (case 15).—Effect of procaine on fever associated with delayed serum sickness following injection of bovine albumin.

Case 14.—J. B., a white man aged 68 with Buerger's disease of the lower extremities, received 25 Gm. of bovine albumin solution AMB$_{2}$ on Feb. 9, 1945 without immediate reactions. On March 8 he was readmitted to the hospital complaining of generalized myalgia, arthralgia, generalized petechial rash and fever ranging up to 102.2 F. He received 1 Gm. of procaine in 500 cc. of saline solution intravenously on the 9th and again on the 10th with temporary relief of symptoms for several hours following each injection. After a third injection on the 11th he had no further recurrence of symptoms.

Case 15.—A. M., a white man aged 59 with melanoma of the right heel, received an injection of 25 Gm. of bovine albumin solution AMB$_{1}$ on March 23, 1945 without immediate reactions. On April 15 he developed generalized muscle pain and painful swelling of the wrists, elbows and shoulders. He received 1 Gm. of procaine in 500 cc. of saline solution on the 15th, with considerable relief from the myalgia and arthralgia. His temperature, however, remained elevated up to 102 F. The relief from joint and muscle pain was only temporary, and a second injection of procaine was given on the 16th, with temporary relief of joint and muscle pains and a fall of temperature from 102 F. to 98 F. Following a third injection of procaine on April 17 there was no further return of the myalgia and arthralgia, and the temperature remained within normal limits (chart 3).

Case 16.—V. B., a white woman aged 40 with carcinoma of the colon, had developed delayed serum sickness following the injection of bovine albumin solution on two previous occasions (on July 26, 1943, nineteen days following the injection of bovine albumin solution ACB$_{29}$ and on April 30, 1944, five days after the injection of bovine albumin solution ACB$_{33}$). On Aug. 8, 1944 she developed an anaphylactoid immediate reaction of moderate severity after receiving 2.5 Gm. of bovine albumin solution ACB$_{41}$. This was treated successfully by the intravenous injection of procaine. She developed serum sickness a third time nineteen days after the injection of bovine albumin solution ACB$_{41}$, but on this occasion it was milder than on the previous occasions, consisting of urticaria alone. Intravenous procaine on August 21 afforded complete relief from the wheals and itching.

IMMEDIATE ANAPHYLACTOID REACTION FOLLOWING THE INJECTION OF BOVINE ALBUMIN

One patient who developed an anaphylactoid reaction during the injection of bovine albumin solution was treated by means of intravenous procaine with satisfactory results. Because the procaine solution must be dripped slowly, it was one hour after the onset of symptoms before relief was obtained. Obviously in the more severe type of immediate anaphylactoid reactions this response is not sufficiently rapid. For these, epinephrine still remains the drug of choice.

Interestingly enough, this patient developed delayed serum sickness nineteen days after injection, but on this occasion it was definitely much less severe than on previous occasions.

IMMEDIATE REACTIONS ATTENDING INTRAVENOUS INJECTION OF BOVINE ALBUMIN

V. B., a white woman aged 40 with carcinoma of the colon, had developed delayed moderately severe serum sickness following the injection of bovine albumin solution on two previous occasions (on July 26, 1943, nineteen days following the injection of bovine albumin solution ACB$_{29}$, and on April 30, 1944, five days after the injection of bovine albumin solution ACB$_{33}$). On this occasion, on Aug. 8, 1944, she developed an immediate reaction consisting of dyspnea, generalized urticaria and itching after receiving 2.5 Gm. of bovine albumin solution ACB$_{41}$. She was then given 1 Gm. of procaine in 500 cc. of saline solution intravenously in two hours, with relief of symptoms within one hour after the procaine solution had been started. The patient again developed delayed serum sickness nineteen days after the injection of the bovine albumin solution ACB$_{41}$, but on this occasion it was milder than on previous occasions, consisting of urticaria alone, and this subsided promptly and completely after 1 Gm. of procaine was given intravenously on August 21.

SERUM SICKNESS FOLLOWING THE INJECTION OF ANTITETANUS SERUM

Because of the elective nature of the surgical problems at the University Hospital, few acute emergency cases necessitating employment of antiserums have been available to us for study. The 1 patient whose clinical story is described in detail had a very gratifying result following the intravenous injection of cocaine, after the usual therapeutic agents had been used without benefit:

Case Summary.—T. B., a white woman aged 22, a nurse, had received 1,500 units of antitetanus serum five days prior to admission on June 1, 1945 for a contaminated laceration of the hand. She presented herself with the typical signs and symptoms of serum sickness, i. e. urticaria, itching, painful adenopathy, myalgia and arthralgia. She was given 5 minims (0.3 cc.) of 1:1,000 epinephrine hydrochloride every six hours for three days without relief. The patient at this time developed difficulty in breathing and swallowing, as well as edema of the eyelids, compelling hospitalization. In addition to epinephrine she was given codeine, amytal and ephedrine in repeated doses, without relief. On June 2, 1945 she received 1 Gm. of procaine in 500 cc. of saline solution intravenously over a two hour period, with considerable improvement of all signs and symptoms immediately. After the solution had run in, some joint and muscle pains persisted, but the difficulty in swallowing and breathing had disappeared almost completely. The following day she was given 1 Gm. of procaine intravenously again, with complete subsidence of all signs and symptoms. She was checked again three weeks later and had had no recurrence of serum sickness.

URTICARIA

Two cases of urticaria caused by known sensitizing agents both responded satisfactorily to intravenous procaine. In 1 patient, who had repeated attacks, an attempt to provide prophylaxis by daily injections of procaine resulted in lengthening of the period between attacks. There was no apparent decrease in the effectiveness of procaine on repeated injections.

Urticaria of Specific Etiology.—H. M., a white woman aged 32 who had recurrent bouts of generalized urticaria of three months' duration, was shown by skin tests to be sensitive to shellfish, eggs, hops, figs, mulberry and kapok. On August 8, 1944 she presented herself with generalized urticaria, for which she received 1 Gm. of procaine in 500 cc. of saline solution intravenously in about two hours, with subsidence of the itch while the solution was being given and disappearance of the wheals within two hours after the solution had run in. She was well until August 15, when she developed generalized urticaria once more and which again responded to procaine therapy. In an attempt to evaluate procaine as a prophylaxis against further attacks, she was given the drug on the 16th and the 17th and she had no further attacks of urticaria until September 11, when she developed urticaria and angioneurotic edema involving the face and arms. Procaine on this occasion also afforded prompt relief. The patient failed to return to the clinic for further check, and her subsequent clinical course could not be determined.

M. C., a white woman aged 48, who developed generalized urticaria and itching following the ingestion of tomatoes on Aug. 22, 1944, on that date was given 1 Gm. of procaine in 500 cc. of saline solution intravenously, with prompt disappearance of the itching and wheals.

Urticarias of Nonspecific Origin.—Of the 5 patients with urticaria due to an unknown sensitizing agent, 4 obtained temporary relief and 1 was not benefited at all. One patient (J. W.), who had particularly severe urticaria, for which the usual therapeutic agents had been given without relief, responded rather dramatically to the intravenous injection of procaine, and repeated injections appeared to afford the patient longer periods of relief. Subsequent to a third injection of procaine he had no further urticaria for a period of a month during which time it was possible to observe him.

Urticarias of Nonspecific Etiology.—D. S., a white woman aged 22, had recurrent bouts of urticaria for six years. Skin tests failed to reveal any specific sensitizing agent. She was given 1 Gm. of procaine intravenously on Aug. 21, 22 and 23, 1944 with temporary relief from the urticaria of approximately two hours' duration on each occasion.

O. C., a white man aged 34, had recurrent bouts of urticaria and itching at variable intervals for twelve years. Skin tests failed to reveal any specific sensitizing agent. On this occasion he received 1 Gm. of procaine intravenously on Aug. 22, 1944 with prompt relief of itching and wheals. Subsequent check revealed that the patient continued to have recurrent attacks of urticaria with the same frequency and severity as before the procaine injection.

B. D., a white man aged 36, who had recurrent bouts of urticaria and dermatographia of three years' duration, was given 1 grain (0.06 Gm.) of procaine in 500 cc. of saline solution intravenously on Sept. 20, 21 and 22, 1944 with relief of symptoms for several hours only after completion of each injection.

M. M., a white woman aged 30, had recurrent attacks of urticaria of five years' duration. Skin tests failed to reveal any specific sensitizing agent. She was given 1 Gm. of procaine in 500 cc. of saline solution intravenously on Sept. 15 and 16, 1944, without relief of symptoms.

J. W., a white man aged 62, with Hodgkin's disease, developed generalized urticaria of a severe degree on Aug. 5, 1944 for the first time. The offending sensitizing agent could not be determined. The usual therapeutic agents, such as epinephrine in oil, calcium gluconate and calamine lotion, failed to give the patient any relief. On Aug. 8, 1944 he received 1 Gm. of procaine in 500 cc. of saline solution, which resulted in complete subsidence of the urticaria and itching for twelve hours. He was given procaine again on the 9th, when the urticaria reappeared and again it caused the wheals and itching to disappear. On this occasion he had no further difficulty for two days. On the 11th he was given procaine again and the urticaria disappeared once more. Subsequent check one month later revealed that the patient had had no further attacks of urticaria.

MISCELLANEOUS CASES

One patient with chronic asthma and 1 with rheumatoid arthritis were given procaine intravenously without benefit. A third patient with status anginosus was much improved following injection of procaine.

Chronic Asthma.—B. C., a white woman aged 60 with repeated bouts of asthma for twenty years, was admitted during a moderately severe attack and given procaine intravenously on three consecutive days without relief.

Rheumatoid Arthritis.—F. C., a white man aged 52 who had chronic rheumatoid arthritis of fifteen years' duration with considerable deformity and pain, was given an injection of 1 Gm. of procaine in 500 cc. of saline solution on Aug. 22, 1944, which afforded the patient no relief.

Status Anginosus.—E. E., a white woman aged 79, had severe repeated attacks of angina pectoris for a period of one year. Following the intravenous injection of procaine she was completely free from attacks for a period of approximately three weeks.

COMMENT

The lack of knowledge of the fundamental causes of anaphylaxis and serum sickness makes any attempt at explanation of the mode of action of procaine in combating their manifestations merely conjectural.

The most widely accepted hypothesis[12] postulates that anaphylaxis and serum sickness are basically different manifestations of the same process, namely an antigen antibody reaction occurring on or in the body cells that have removed the antibody from the blood and in some way fixed it to themselves. This interaction results in cellular injury, with the liberation of toxic protein split products or possibly, as suggested by Dale and his colleagues, histamine or histamine-like substances. It is well known that the injection of histamine in guinea pigs produces a picture similar to but not identical with anaphylactic shock. As well as acting directly on tissue cells, these liberated substances may act on the vascular system both by direct injury to the capillaries or through stimulation of the nerve fibers to the terminal arterioles.

The action of procaine may be explained in a number of ways:

(*a*) Direct action on cells. Certainly the relief of myalgia and arthralgia can best be explained by the anesthetizing action of procaine on the nerve fiber carrying pain stimuli from the muscle and joints.

Leriche[6] postulated a direct action of procaine on the endothelium of the arterioles and capillaries with widespread vasodilatation. We have checked the skin temperatures of the lower extremities in 4 persons without peripheral vascular disease and have found definite evidences of vasodilatation in each instance as evidenced by the increase in skin temperature of the lower extremities following the intravenous administration of procaine.

---

[12] Zinsser, Hans, and Bayne-Jones, Stanhope: A Textbook of Bacteriology, ed. 8, New York and London, D. Appleton-Century Company, 1939, pp. 221-229.

(*b*) Anti-histamine action. Few data are available on this point. In dogs procaine is unable to inhibit the stimulus to gastric juice secretion of histamine.[13]

(*c*) Anti-acetylcholine action of procaine, as already stated. Harvey[9] and his co-workers have shown that procaine not only depresses the response of the synapses of the sympathetic ganglions as well as terminal efferent nerve fibers to acetylcholine but also decreases the amount of acetylcholine liberated at these sites. Some of the manifestations of serum sickness, particularly the spreading flare about the wheals, are probably due to the liberation of acetylcholine at the nerve fiber endings at the terminal arterioles; and their disappearance after the injection of procaine might logically be explained on this anti-acetylcholine action.

(*d*) Epinephrine potentiating action of procaine. Although the amounts of epinephrine secreted in the body may not in themselves be sufficient to combat the manifestations of serum sickness, still the potentiation by procaine may be of sufficient degree to accelerate the rate of disappearance of these manifestations.

It is indeed noteworthy that our findings attesting the value of procaine in the treatment of serum sickness are contrary to those of Breton and Gedoux,[8] with whose work we were unfamiliar until the literature of the subject was reviewed in the preparation of this paper for publication. The explanation for this discrepancy possibly is to be accounted for in the differences of dosages of the drug used: they gave only 1 mg. per 10 Kg., i. e. 7 mg. for a 70 Kg. person, whereas our patients received 0.9 to 1 Gm. over a two hour interval.

SUMMARY AND CONCLUSIONS

One Gm. of procaine diluted with 500 cc. of saline solution administered over a two hour period has been given to 27 patients without untoward reactions.

Ten of the 16 patients with serum sickness following the injection of bovine albumin obtained complete relief and an additional 4 temporary relief after the intravenous administration of procaine. Two were not benefited.

The rather striking relief noted in the case of serum sickness following the use of tetanus antitoxin suggests that procaine may prove extremely useful in the management of serum sickness attending the use of tetanus antitoxin.

Six of 7 patients obtained relief from urticaria and other manifestations of hypersensitiveness whether the sensitizing agents were known or not. No patient, however, was cured of the sensitivity state.

Procaine must be administered at too slow a rate to make its use feasible in severe immediate anaphylactoid reactions. Epinephrine remains the drug of choice in such circumstances.

One patient with chronic asthma and another with chronic deforming rheumatoid arthritis were not benefited by repeated procaine injections.

The elevation of skin temperatures of the lower extremities in 4 patients and the excellent response of 1 patient with status anginosus following the intravenous injection of procaine would suggest the possible use of procaine in conditions associated with vasospasm or Raynaud's disease, Buerger's disease, arteriosclerosis with superimposed vasospasm angina pectoris and thrombophlebitis.

The exact mode of action of procaine in the treatment of serum sickness and sensitive states is not known.

HEALTH OF REPATRIATED PRISONERS OF WAR FROM THE FAR EAST

BRIGADIER GENERAL HUGH J. MORGAN
United States Army
COLONEL IRVING S. WRIGHT
Medical Corps, Army of the United States
and
LIEUTENANT COLONEL ARIE von RAVENSWAAY
Medical Corps, Army of the United States

On the completion of hostilities with Japan it was inevitable that a large number of allied prisoners of war would be released from Japanese prison camps. Approximately one third of these were American. The period of captivity had ranged from three and one-half years to a few days. The conditions under which most of them had lived were those of starvation, filth and lack of suitable clothing, with periods of definite torture. Thousands died as a result of these hardships. It was believed that a careful health survey of those who survived might be of value in helping to determine the best future care for them, the possibility of the prevention of the spread of communicable conditions in their families and communities, and a better understanding of the changes which take place in man after exposure to such living conditions. To achieve these objectives a board was established by the Surgeon General for the purpose of conducting such a survey. The personnel consisted of Brig. Gen. Hugh J. Morgan, U. S. Army, president; Brig. Gen. Rex McK. McDowell, U. S. Army; Brig. Gen. William C. Menninger, U. S. Army; Col. Walter A. Carlson, M. C.; Col. William P. Holbrook, M. C.; Lieut. Col. James T. McGibony, M. C.; Major Gustave J. Dammin, M. C., and Capt. John S. Hunt, M. C.

Col. Irving S. Wright, M. C., was appointed as coordinator for this survey, and Lieut. Col. Arie C. van Ravenswaay, M. C., was appointed assistant coordinator representing the Air Surgeon. Teams of specialists[1] were assigned to three debarkation hospitals on the West Coast, namely Madigan General Hospital, Letterman General Hospital and Camp Haan Debarkation Hospital, and to Halloran General Hospital on the East Coast. Teams were set up at Hamilton Field Debarkation Hospital and at Fairfield-Suisun Station Hospital, which were later consolidated with the team at Letterman General Hospital. A survey team was also established at Mitchel Field A. A. F. Regional Hospital.

A total of 4,618 patients were surveyed. Of these, 3,204 were surveyed at Letterman General Hospital, 886 at Madigan General Hospital and the remainder at the hospitals on the East Coast. No patients were surveyed at Camp Haan Debarkation Hospital. The team from that hospital was used to aid in the survey at Madigan General Hospital.

The survey began on Sept. 1, 1945 and was terminated Oct. 22, 1945.

STATISTICAL ANALYSIS OF SURVEY RECORDS

The findings resulting from the study of these patients were entered on master forms. They were later transferred to punch cards and subjected to machine statistical analysis. The significant findings with their broader connotations are herewith presented:

---

[13] Baronofsky, I.: Personal communication to the authors.

[1] Specialists in internal medicine, neuropsychiatry, dentistry and clinical pathology were assigned, as were technicians These teams supplemented the staffs of the general hospitals in which the survey was made.

1. *Nutrition.*—The nutritional state of the released prisoners was of first importance. It was at first thought that a study of the weights, at the time of capture, the time of release and the time of the survey would give fairly accurate information in this regard. Such figures, while of interest, do not reveal the whole picture of what took place with these men for the following reasons:

(*a*) The weight at the time of capture frequently did not reveal the normal weight. Many of the troops captured in the Philippines had been on starvation diets and had suffered from dysentery and malaria for many weeks before capture. Some had lost 30 to 50 pounds before capture.

(*b*) The weight at time of release did not represent the lowest weight. Many of the prisoners reached their lowest weights within the first six months of imprisonment, while they were still in the Philippines or Formosa. When they were moved to Manchuria, many improved in nutrition after they received more soy bean flour. During the last month before release, many gained weight as a result of food supplies dropped in the prison camps by bombers from the United States Army Air Forces.

TABLE 1.—*Correlation of Weights, Heights and Age Groups Among Repatriated American Prisoners of War*

Age Group	Height Range, Inches	Number	Average Weight, Pounds			Extreme Loss in Group, Capture to Release, Pounds
			Capture	Release	Time Survey	
19	66 - 72	15	154	118	148	174 to 100
20 - 24	59 - 79	1,080	154	132	156	252 to 200
25 - 29	59 - 82	2,331	154	132	157	185 to 114
30 - 34	53 - 78	665	153	131	156	158 to 110
35 - 39	60 - 75	250	156	133	157	134 to 84
40 - 44	64 - 76	85	156	130	154	200 to 139
45 - 49	63 - 74	33	163	134	152	180 to 133
50 - 63	59 - 75	87	158	135	147	220 to 143

(*c*) The weight at the time of the survey was subject to a varying interpretation, depending on the length of time between the release of the prisoner and his examination. The first prisoners were flown across the Pacific and represented more nearly the picture at the time of release. Later groups had been receiving American food and care for more than a month before reaching the survey line. It should be noted that the weight at the time of the survey frequently exceeded that recorded at the time of capture for reasons explained under paragraph *a*. With these qualifications the general trend of the weights charted against the heights and age groups is herewith presented in table 1.

A very few prisoners actually gained weight between capture and release. There were two explanations for this phenomenon: Either they were very ill at the time of capture and recovered or they were cooks or mess attendants and, hence, in a position to purloin food more easily than their fellow prisoners. The very narrow ranges of the average weights at the time of capture, release and survey are noteworthy.

While the total weight of many of these patients at the time of the survey was equal to their former normal weight, examination with particular attention to their shoulder girdles and extremities indicated that their nutritional state as evidenced by muscular development was far below normal. The newly gained weight in these persons was largely confined to their protuberant abdomens, or so-called "rice bellies."

It was obvious that the deficiencies from which these patients suffered were multiple. Therefore any attempt to classify the findings in the light of specific vitamin, protein or mineral deficiencies is fraught with definite hazards of misinterpretation or overinterpretation. It is considered wise, therefore, to be content with a listing of the lesions which may have been due to deficiency diets with their incidence in 4,618 prisoners surveyed (table 2).

Additional correlation of the neurologic status as indicated by the relation between type of disease and incidence of physical findings is to be found in table 3.

* This figure represents only a small proportion of those men who at some time during their imprisonment had definite edema. Further reference to this problem will be found elsewhere in this report.

2. *Blood Pressure.*—The range of systolic and diastolic blood pressures was recorded and analyzed. No outstanding deviations from the normal expectancy were noted.

LABORATORY FINDINGS

1. *General Statement.*—The laboratory data obtained in this survey were undoubtedly modified to a considerable degree by several factors. Most of the men had been liberated from prisons several weeks prior to their examination in this country. During this time they had received varying degrees of medical care. All had been given high caloric, high vitamin diets. Some had received whole blood and plasma transfusions as well as liver extract and vitamins parenterally. Many received chemotherapy for various reasons, and on

some of the ships the use of vermifuges was widespread. As a result of these essential measures there was a decided improvement in the physical well being of these men, with a concomitant diminution of abnormal hematologic, parasitologic, chemical and bacteriologic findings. One of the findings of interest was the fact that, with the exception of stool parasite studies, the laboratory data obtained from the prisoners tended more and more to approach normal as the survey progressed.

2. *Stool Examinations for Parasites.*—Throughout the whole study the proportion of prisoners found to be harboring intestinal parasites was uniformly in the vicinity of 60 to 70 per cent, with many yielding from two to six different species of parasites (table 4). It is believed that this represents a very conservative figure, since (*a*) many had received vermifuge treatment and (*b*) only a single stool specimen was examined rather than the usual series of three or more stool examinations.

It was found that these men were heavily seeded with ascaris and hookworm. On the other hand it should be noted that Endameba histolytica was found in approximately 7 per cent, a figure not significantly different from that expected in the population of certain areas of the United States. No carriers of Schistosoma japonicum in this series presented any physical signs of schistosomiasis.

3. *Stool Cultures for Enteric Pathogens.*—It was noted that the incidence of Shigella and Salmonella carriers tended to decrease as the survey progressed. Most carriers harboring these enteric pathogens tend to lose their micro-organisms within a period of one or two months after infection. The total number of carriers of Shigella organisms was 80. The total number of carriers of Salmonella organisms was 108. All species of Shigella isolated are commonly found in the United States.

4. *Hematologic Examinations.* — The hematologic examinations carried on in this survey were divided into routine examinations including the determination of hemoglobin and the eosinophil percentage. The range of these two findings is given in table 4.

A study was made on the blood film for malarial plasmodia and filariae. The yield was extremely low for these parasites. Only five smears showed vivax, one showed falciparum and none showed filariae. Careful histories revealed, however, that 2,519 men believed that they had had malaria sometime during their imprisonment. Since most of these men had received little or no antimalarial therapy during their imprisonment, this adds considerable evidence to the belief that malaria will "burn itself out" without treatment over a period of from a few months to several years.

A detailed study was carried out on 75 anemic patients to determine the types of anemia found and the relation of such anemias to the nutritional state of the patient. This study was carried out by 1st Lieut. George E. Cartwright, M. C. These men had been on a grossly inadequate diet consisting mainly of rice for an average of forty months. The average loss of weight was 37 pounds (17 Kg.). A history of nutritional deficiency as characterized by cheilosis, glossitis, stomatitis, dermatitis and diarrhea was obtained in 50 to 70 per cent. A history suggesting wet beriberi was obtained in 77 per cent, and a history of dry beriberi was obtained in about 50 per cent. Anemia was observed in 52 per cent of the first 1,500 released prisoners surveyed. The incidence of anemia diminished as successive groups were examined, the obvious explanation being an increase in the length of time after release from the prison camps. Six weeks after the study was commenced anemia was found in only 35 per cent. Anemia as present in this group was macrocytic in 73 per cent, normocytic in 23 per cent and microcytic in 4 per cent. Differential counts were not remarkable except for frequent occurrence of an eosinophilia. Blood smears showed numerous macrocytes, anisocytosis, polychromatophilia and occasional nucleated red cells. Approximately half of the men studied had normal serum iron and copper values. The other half were characterized by hypoferremia and hypercupremia. The etiologic factors concerned in the production of these anemias were complex. They included severe nutritional deficiencies, intestinal parasitic infestations and other causes, including dysentery, malaria, blood loss and infections.

5. *Plasma Protein Levels.*—Plasma protein levels were studied in the first 1,190 patients received at Letterman General Hospital. Only 2 showed values outside of the range of 6.0 and 8.4 Gm. per hundred cubic centimeters. This study was therefore discontinued.

6. *Urinary Specimens.*—Urinary specimens from 3,400 patients were studied. The frequency of urinary

tract disease did not differ much from that expected in other male groups of comparable age distribution.

7. Calcium and Phosphorus Blood Levels.—Determinations of the blood levels of calcium and phosphorus were carried out on 35 patients. These revealed no abnormalities.

CLINICAL IMPRESSIONS

It is clear that some of the most significant changes do not lend themselves to compilation on master forms and analysis by machine record devices. A summary of these general clinical impressions therefore will be given. Most of these patients were quite cheerful and cooperative; there was evidence of a detachment from reality; absentmindedness was a common finding in the first groups which returned, but as later groups were analyzed a remarkable trend toward normalcy was noted.

A question which constantly recurred among the examiners was why this particular group survived. It was felt that in a sense this was a select group. Many factors doubtless played a part in survival. The factor of chance was important, since any man might have been on a torpedoed Japanese prison ship or slain in a fit of temper by some Japanese soldier. A large percentage of these men had volunteered for military service prior to the onset of the war. These were seasoned soldiers—adjusted to being away from home and schooled in taking care of themselves under adverse conditions. When the prisoners were asked for their opinions in this regard many of them stated that their confrères who had died when the going was difficult had in many instances "lacked the will to live." The "will to live" is an intangible phrase. It is difficult to define, but the men who did not give up were characterized by some of the following qualifications.

TABLE 4.—*Range of Hemoglobin and Eosinophils*

Hemoglobin, Gm	Number of Cases	Per Cent of Total
Less than 8.0	1	....
8.0 to 9.9	9	0.3

h. Amebas with ascaris (correlation)	83

1. They had a never failing hope of rescue.
2. They were possessed of a high morale and courage.
3. They were individuals who adjusted rather easily to difficult situations.
4. They were *nonaggressive* or at least were able to control a tendency to pugnaciousness which, if allowed to evidence itself, frequently resulted in summary death.
5. They were willing to eat anything, however disagreeable, *if it might contain nutritional value.*
6. They were willing to secure food by any and all means. The stealing of food from the Japs became a highly specialized *technic. In one camp at the time of release* the prisoners had more than 2,000 pounds of beans hidden away in diverse places.

Almost without exception, these patients had suffered from diarrhea at some time during their imprisonment. It was necessary to distinguish between diarrhea which *most persons have from time to time in normal life* and true dysentery consisting of prolonged periods of watery or bloody stools. Thirteen hundred and fifty-nine of the prisoners did have one or more attacks *of diarrhea presumed to be true dysentery.*

Wet and dry beriberi occurred with great frequency. Most of the prisoners developed wet beriberi first, followed by dry beriberi. The dry beriberi was characterized in some patients by extremely severe pains or sensitivity. For example, 1 patient who was able to endure Japanese torture methods with fortitude had become so sensitive as a result of beriberi that when another patient passed by the foot of his bed the jarring of the rather unsteady flooring caused him to cry out in pain.

Beriberi heart was encountered but in a high *percentage of victims resulted in death in the prison camps.* Exact statistics regarding this are not available.

A most interesting observation was encountered in many prisoners, namely the development of widespread edema, *particularly involving the lower extremities,* which came on promptly after the receipt of American food. The explanation for this is not clear, but the *following factors suggest themselves: In some instances this edema developed after a generous diet of American* food which included more salt and fluid than the prisoners had been accustomed to. In these instances it was *believed that the salt influenced the retention of fluid* with the development of edema. In other patients, however, this edema arose before they had received a well balanced American diet. These men had received large *amounts of candy, which they craved. One, for example,* had obtained a box of chocolate bars which was dropped near him in a prison camp. He ate more than forty bars of chocolate during the first day. He promptly *became desperately ill with vomiting and diarrhea and* within a few days developed a well defined edema for the first time since being captured. Either the increased demand of carbohydrate metabolism for thiamine and perhaps other members of the vitamin B complex or the loss due to the vomiting and diarrhea *may* have been a severe enough drain on the *depleted* supplies *stored in the patient's body to produce* an acute state of wet beriberi.

Outbreaks of jaundice occurred in several Japanese prison camps. A moderately severe *outbreak occurred* at Cabanatuan in May, June and July of 1942. Other outbreaks occurred at Kawasaka, Moetsu and Omari. Characteristically *the disease resembled infectious hepatitis, with nausea, vomiting, malaise, fever* and jaundice. Only 15 liberated prisoners showed *evidence of* jaundice at the time of the survey. It is of interest that in practically all cases the disease was *limited to one* month or less and most of the patients were ambulatory. Many continued manual labor. Several explanations suggest themselves:

1. The etiologic agent *may not have been* as virulent as that encountered in the European theater.
2. The diet, though low in calories, vitamins and proteins, was limited practically entirely to carbohydrates. This may have constituted a favorable diet for persons with this disease.

Five hundred and five men reported having had pneumonia. One hundred and one out of 3,742 checked showed evidence of active pulmonary tuberculosis on x-ray examination. This is a high percentage of infection and indicates that exposure of these prisoners to tuberculosis must have occurred frequently.

Dermatologic observations were of interest. Not a single instance of lichenoid disease of the type now associated with atabrine therapy was found in this survey. Practically none of these patients had received any atabrine. Many had never heard of the drug. Pyogenic infections of the echthymatous type were frequent. Outbreaks of diphtheria, both skin and faucial, were common, and in certain camps deaths occurred from diphtheria. A scar not dissimilar from the scar of skin ulcers due to diphtheria was found to have been produced by the so-called "fire treatment" of Japanese doctors which was used not only on American prisoners but on their own troops. This consisted in applying a small pellet of sulfur to the skin and igniting it. An ulcer was produced which inevitably became infected. This form of treatment was applied in diverse parts of the body, depending on the disease being treated.

A curious combination of skin and mouth lesions was noted. Numerous patients gave a history of stomatitis associated with a dry scaly dermatitis of the scrotum. The incidence of this was believed to be greater than would be expected on a coincidental basis. The mouth lesions usually cleared up first after the patient received a well rounded diet.

The psychiatric findings were summarized as follows: The appearance of the patients varied with the length of time of their imprisonment and the length of time between their release and their examination. Those examined within ten days of their release appeared somewhat dazed, moderately euphoric and somewhat childlike in their reactions. Some of them were very apprehensive about returning to their homes and families, feeling that they might not be able to stand the strain of returned civilian life with its responsibilities. Those who had been released for a longer time tended to approximate the normal more closely. The men who had been in prison for long periods showed more definite psychologic changes than those who had been in prison a short time even though the treatment of the latter might have been harsher, as in the case of certain B-29 crews who had come down in Japan. In general, the personality structure represented a mixture of superficial feeling of well-being and a feeling of insecurity. A feeling of hostility toward the Japanese was almost universal. Food had been the one great motivating factor in their lives during starvation periods. They worked and lived for food alone, and their dreams were mostly of food. During periods of severe starvation there was a decided loss of sexual interest. Thoughts and dreams of women disappeared from their lives, even in many cases thoughts of those whom they really loved. Homosexuality became a negligible factor. The few examples of it were to be found among kitchen and hospital help who were able to receive slightly better nourishment. In other words, as the primitive desires were lost the desire for food was the last one to be held.

DENTAL SURVEY

A detailed study of the dental examination forms has not been completed at this time, but as far as this study has progressed no unusual pathologic conditions of the teeth were manifested. The number of carious teeth was less than that of the same age group living under normal conditions, which might be accounted for by the low amount of sugars in their dietary regimen. X-rays of the maxillas did not disclose any excessive bone destruction, and the bony pattern was considered normal.

COMMENT

The foregoing has been an abstract of the findings from a health survey of 4,618 repatriated American prisoners of war from the Far East,[2] with an analysis of the results of prolonged malnutrition and mistreatment and a discussion of the significance of these effects. Striking deviations from the normal include loss of weight, neurologic changes, a high incidence of pulmonary tuberculosis, muscular wasting, dermatologic mainfestations and psychologic changes. Significant laboratory findings include a high incidence of infestation with intestinal parasites, anemia, especially macrocytic, and eosinophilia.

THE FENESTRATION OPERATION FOR OTOSCLEROSIS

GEORGE E. SHAMBAUGH Jr., M.D.
Chicago

The fenestration operation for improving the hearing in otosclerosis rests on a very simple principle: the creation of a new window into the labyrinth to take the place of the oval window which has become occluded by the otosclerotic bone proliferation.

The history of the fenestration operation is the story of the search for a method of making a labyrinthine fistula that will remain open. The essentially international character of science is exemplified in this search. Passow in Germany in 1896 first made a new opening into the labyrinth in a case of otosclerosis, but the hearing improvement lasted only a few days. Jenkins in England, Bárány in Vienna and Holmgren in Sweden successively attacked the problem, but invariably the hearing improvement was of brief duration as new bone formation closed the labyrinthine fistula within a few weeks or months. Engstrom,[1] working with Holmgren in Sweden, carried out extensive experiments on the monkey, but with every technic that was tried the fistula always closed.

Sourdille[2] in France took up the problem between 1924 and 1937 and finally elaborated a complicated three or four stage operative technic with which for the first time a labyrinthine fistula was made that remained open in some cases for more than five years with a sustained hearing improvement. Sourdille's "tympanolabyrinthopexy" consisted essentially in making a new window into the horizontal semicircular canal and in covering this window with a plastic skin flap continuous with the tympanic membrane. The vibrations of the tympanic membrane in response to sound waves were thus transmitted directly to the fluid within the labyrinth. The principle of the Sourdille operation has continued to be the principle of the fenestration operation to the present day. Sourdille's procedure, however, failed to gain general acceptance because the several stages, each separated by months of convalescence, made the operation impracticable for the average patient. The electrical hearing aid and lip reading were still the only recourse for the approximately 1 per cent of all white adults that develop progressive deafness due to otosclerosis.

---

[2] The complete report of these findings will be published in the Surgeon General's History of World War II.

Read before the National Cardiologic Institute of Mexico, Mexico City, Dec. 11, 1945.

Meanwhile the problem of the surgical restoration of hearing in otosclerosis was taken up in America by Lempert,[3] who published his first report in 1938. Lempert combined Sourdille's multiple stage procedure into a practical one stage operation which he named the fenestration operation. The critics predicted that the Lempert fenestration operation, like its predecessors, would fail as the result of bony closure of the labyrinthine fistula. This prediction was partially borne out, as many of the early patients operated on by Lempert, myself and others lost their hearing improvements in the course of the first postoperative year.

In January 1940 I reoperated on my first patient, who, first operated on in July 1938, had experienced a definite hearing improvement amounting to a gain of 19 decibels for the speech frequencies. Six weeks after operation, however, his hearing began to recede, soon reaching the original preoperative level (fig. 1). At reoperation, when the skin flap was elevated from the bony horizontal semicircular canal the polished bone surface appeared unchanged but the fistula was completely occluded by a plug of new bone. This plug was carefully removed, the skin flap was replaced and the patient experienced a very satisfactory hearing improvement amounting to a gain of 27 decibels for the speech frequencies. This hearing improvement has been maintained without loss for six years (fig. 2).

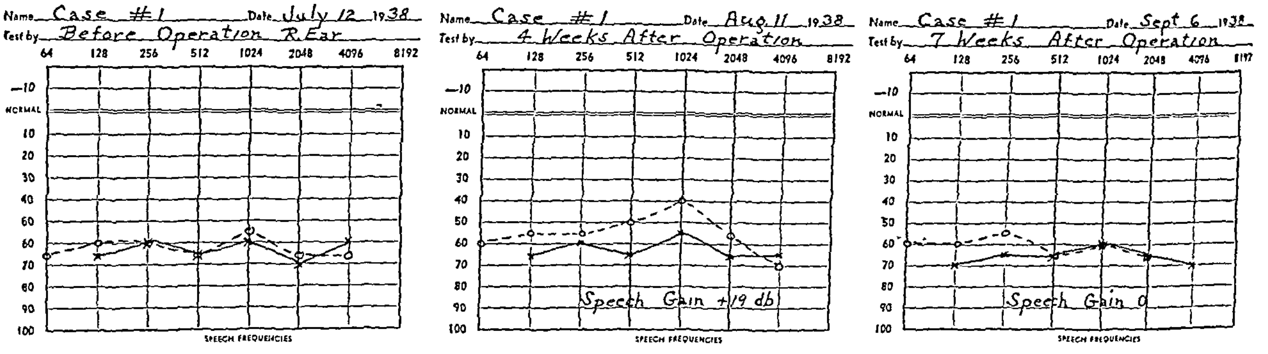

Fig. 1 (case 1).—Audiometric tests before and after fenestration operation: solid line, left ear; broken line, right operated ear.

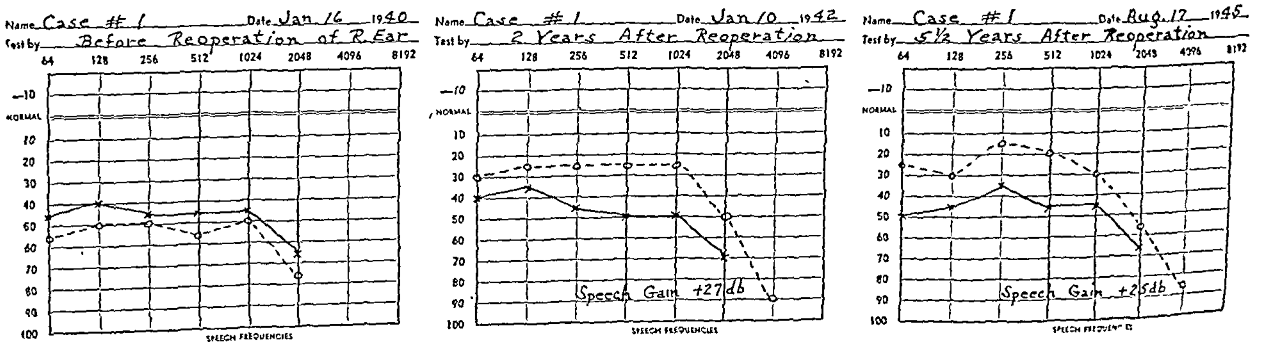

Fig. 2 (case 1).—Audiometric tests before and after reoperation.

The bony plug removed from the fistula in this first case had a coarsely granular appearance and consistency, suggesting that it had been formed from bone dust. Since with the technic then employed bone dust from the dental finishing burr inevitably collected in the perilymph space of the labyrinth, from which it could hardly be removed without damaging the extremely delicate membranous labyrinth, I devised a simple irrigating apparatus to maintain a constant flow of sterile isotonic solution of sodium chloride across the bone during the creation of the fistula. Not only did the irrigating apparatus prove effective in washing away every particle of bone dust but it kept the operative field immaculately clean and free from blood, so that for the first time I was able to see clearly the membranous labyrinth floating in the perilymph of the horizontal semicircular canal. The use of a binocular dissecting microscope to take advantage of the improved visibility so as to make a more perfect fistula logically followed. Immediately the results of the operation were greatly improved, so that in December 1941 I[4] was able to report 88 per cent of patients operated on enjoyed hearing improvements six months or longer after operation, a higher percentage than had been reported heretofore by any previous technic.

In 1941 Lempert[5] described the "fenestra nov-ovalis," in which the fistula is made anteriorly into the widened ampullated portion of the horizontal semicircular canal, permitting the creation of a larger fenestra. I have used the nov-ovalis operation combined with the constant irrigation and microscope technic[6] in 822 consecutive operations during the past four years.

These improvements in the fenestration operation have resulted in greater average hearing improvements in a larger percentage of cases. The reports that have been published, however, do not give sufficient data to permit one to reach any exact conclusions concerning the ultimate permanence of the hearing improvements after the fenestration operation. Either the reports of cases several years or more after operation are incomplete and include only a selected few of the better results, or the reports of a consecutive series of cases are too recent to be regarded as permanent.

The present experimental and clinical investigation was undertaken to determine as far as possible the permanence of the artificial fistula in the labyrinth created by the fenestration operation as it is now done.

The experimental studies of labyrinthine fistulas have been carried out at Northwestern University during the past four years.[7] Monkeys were used, because the far reaching similarity between the ears of man and of monkey should make the results applicable to the human being. By means of tiny instruments especially made for the fenestration operation on the monkey, it has been possible to duplicate in every essential detail the technic that I have used on the human being during this time.

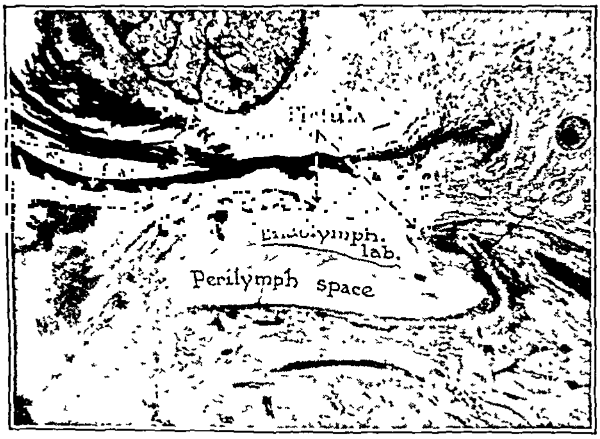

Fig. 3.—Labyrinthine fistula is wide open in monkey one year and six days after operation by nov ovalis fenestration technic with constant irrigation and microscope

The irrigating apparatus and the microscope were found to be even more indispensable in making a perfect fistula in the monkey than in the human being. With this technic we have been successful for the first time in making a labyrinthine fistula in the experimental animal which has remained open with a positive fistula test longer than a year after operation (fig. 3).

By killing the monkeys at different intervals after operation and examining the ears microscopically we are able to reconstruct what occurs in the human ear after the fenestration operation.

The first evidence of osteogenesis is seen on the fourth day after operation in a heaping up of osteoblasts along the periosteum of the mastoid air cells. By the end of the first week trabeculae of pink staining new bone begin to appear in the thickened mucosal lining of the mastoid air cells (fig. 4). At the fistula, however, new bone formation is definitely retarded and inhibited since it appears later and in considerably smaller amount than elsewhere. This new bone begins from the periosteal layer of the bony labyrinthine capsule (fig. 5) and tends to extend under the skin flap toward the fistula mouth. About the same time, that is about two weeks after operation, new bone begins to spring from the endosteal layer of the capsule within the margins of the fistula, especially if the endosteum has been traumatized. By the end of the third week osteogenesis at the mouth of the fistula is very active in many ears with pale pink staining new bone growing from all three layers of the capsule but particularly from the periosteal and endosteal layers (fig. 6). About six weeks after operation osteogenesis passes its peak of activity in most ears, while at four months it frequently appears to have slowed down almost to a stop with practically no pale pink new bone, and the healing processes at the fistula appear virtually completed (fig. 7).

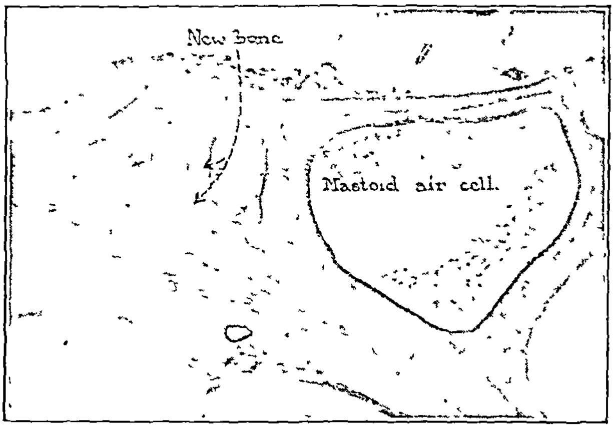

Fig 4.—Osteogenesis beginning in mastoid air cells of monkey one week after fenestration.

Study of monkey operations carried out on 42 ears with various modifications of technic indicate that the following factors govern osteogenesis after the fenestration operation:

1. Probably the most important single factor that permits us to make a fistula into the labyrinth that frequently remains open is the peculiarly sluggish response to trauma of the enchondral layer of the labyrinthine capsule. The enchondral bone of the labyrinthine capsule is unlike bone anywhere else in the adult skeleton. It may be recognized by its islands of ossified cartilage. Once formed by ossification of the primitive cartilaginous otic capsule during the fifth month of fetal life, it remains relatively unchanged and inert throughout idividual. Everywhere else in the body,

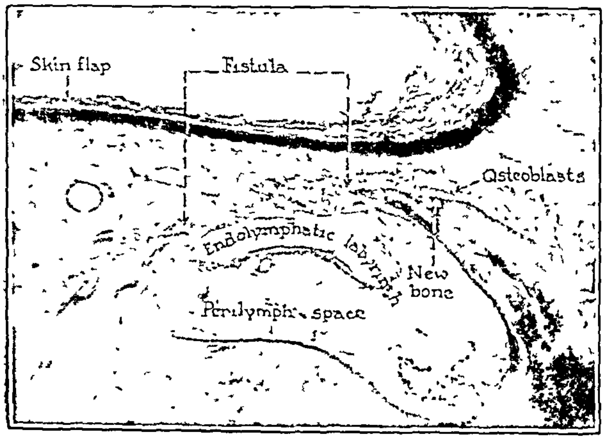

Fig. 5.—Beginning osteogenesis near the labyrinthine fistula of monkey ten days after fenestration.

---

[7] Under a Research Grant from the Markle Foundation to Northwestern University.

bone derived from fetal cartilage is later resorbed and replaced by periosteal bone.

The sluggish response of enchondral bone to trauma has long been known to otologists, who have observed fractures through the labyrinth that remained unhealed except for fibrous tissue for many years. Our monkey experiments have confirmed the fact that the enchondral layer responds less readily to trauma with new bone formation than does the thin inner endosteal layer of the capsule or the thick outer periosteal layer.

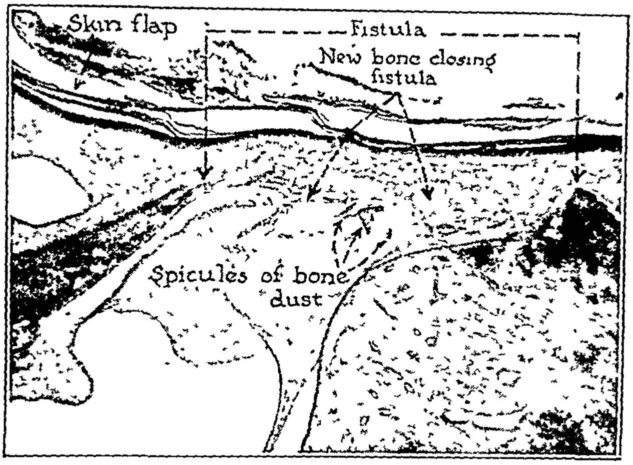

Fig 6.—Osteogenesis rapidly closing the fistula in monkey three weeks after fenestration.

With the fenestration technic that I now use, I take advantage of the relatively inert properties of the enchondral layer by exposing it as widely as possible beyond the margins of the fistula. In order to accomplish this I reduce the superior bony wall of the fistula to a thin shell of enchondral bone, so that the completed fistula lies on the top of a mound rather than at the bottom of a depression (fig. 8).

2. The inhibiting effect of stratified squamous epithelium on osteogenesis is a major factor in maintaining a permanently open labyrinthine fistula. Otologists have long been familiar with the permanence of spontaneous labyrinthine fistulas produced by cholesteatomes where stratified squamous epithelium lies against the bone, as contrasted to the temporary nature of fistulas produced by other types of bone disease. Orthopedic surgeons recently have employed Thiersch grafts to line osteomyelitic cavities in bone after curettage of the diseased bone, and they have remarked on the fact that such cavities lined by skin show no tendency whatever to fill in with new bone, whereas with any other type of treatment the bony defect tends to fill in by osteogenesis. Our monkey studies clearly show the inhibiting effect of skin on new bone formation, and they show further that the closer the epithelium lies to the bone the greater its inhibiting effect, and therefore the thinner the skin flap the better (fig. 8).

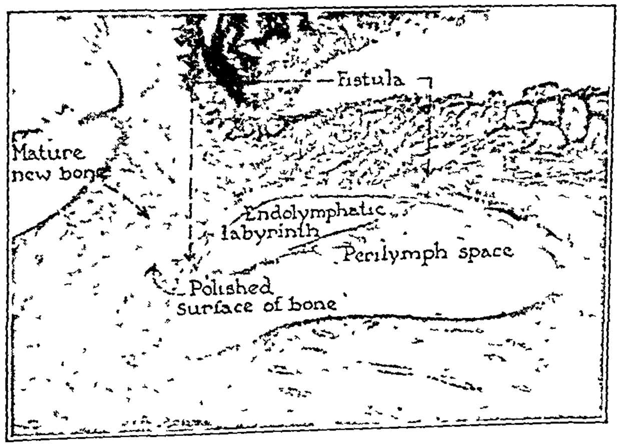

Fig 7.—Osteogenesis and healing virtually completed and fistula wide open in monkey four months after fenestration Note the absence of osteogenesis from the polished bone surface of the fistula margin.

3. The third major factor influencing osteogenesis is the presence of bone dust or bone chips. Orthopedic surgeons have long known that bone dust and fragments exert a powerful stimulus to osteogenesis. It has been shown that this effect is chiefly chemical, so that the bone fragments need not be viable. The striking and immediate improvement in my results when the constant irrigating technic was introduced is attributable to its success in washing away every particle of bone dust (fig. 9).

Complete removal of the endosteum over the mouth of the fistula is required to remove the particles of endosteal bone that remain adherent to it. This is best accomplished by the use of adequate magnification with the microscope in a field kept immaculately clean by the constant irrigating apparatus.

Table 1.—*Summary of Fistulas That Closed*

Technic	Total Operations	Fistulas Closed to Date: Number	Fistulas Closed to Date: Percentage
I. Original Lempert fenestration operation	15	8	53
II. Irrigating apparatus added	30	7	23
III Irrigating apparatus and microscope added	63	16	25
IV. Nov ovalis operation with irrigation and microscope	822	22	3

Table 2—*Time After Operation That Fistulas Closed*

Technic	Total Closed	Months After Operation: 2	4	6	8	10	12	18	24	30
I	8	4	1	2	1	..	..	..	..	..
II	7	..	4	..	..	..	2	..	..	1
III	16	3	1	3	4	1	2	1	..	..
IV	22	..	1	1	6	6	2	3	3	..

4. The endosteum, like periosteum, is a very thin layer of dense connective tissue closely applied to the inside of the bony labyrinth. Immediately beneath it lies the thin endosteal layer of the bony capsule. This endosteal bone reacts readily and promptly by osteogenesis to any trauma that interrupts the integrity of the endosteal membrane. *Avoidance of instrumentation to the bony walls within the mouth of the fistula is essential to avoid injury to the endosteum.*

5. In the healing of bony defects any irregularities tend to be smoothed over by new bone formation; leaving the bone surface smooth and polished eliminates this normal incentive to bone formation (fig. 7).

6. The intact endolymphatic membranous labyrinth in the mouth of the fistula becomes closely adherent to the skin flap and acts to hold the mouth of the fistula open (figs. 7 and 8).

The ideal fistula is covered by the thinnest possible skin flap closely adherent to the bony margins, the enchondral bone of the capsule is widely exposed around the mouth of the fistula, the endosteum covering the mouth of the fistula with its adherent bone particles is completely removed and bone dust is prevented from entering the perilymph space, and the endolymphatic labyrinth within the fistula remains intact (fig. 8). Our experimental studies indicate that no single one of these factors that inhibit osteogenesis is sufficient by itself to prevent closure, but attention to all of the factors will frequently result in a permanently open labyrinthine fistula in the monkey (fig. 3).

For our clinical study of the permanence of the hearing improvements after the fenestration operation we have available the complete data on 930 consecutive fenestration operations carried out by me during the past seven and one-half years. There have been no fatalities, operative or postoperative. There were only two serious complications, consisting of postoperative facial nerve paralysis with only partial recovery a year after operation.

It is generally agreed that in judging the results of treatment for deafness audiometric tests must be used. The preoperative hearing level is the average of three or four hearing tests taken on different days before operation. Since it is the patient's ability to understand speech that we are mainly interested in, we average the decibel loss for the three speech frequencies of 512, 1,024 and 2,048 cycles as the "preoperative decibel loss for speech." The postoperative result is expressed in terms of decibels gained or lost from the preoperative level for speech. To be significant this gain or loss must exceed the preoperative level by at least 10 decibels. The complete summarized data on every patient are kept on a "fenestration score board" which hangs in the Wesley Memorial Hospital in Chicago and which is available for all to see. Every time a patient is retested, his audiometric data on the score board is brought up to date. Audiometric tests are made every few months the first year after operation and at least once a year thereafter.

† Patients not included in this group were operated on more recently than two years ago or did not return after two years for an audiogram.

In our clinical study of the permanence of the fistula we must differentiate between a fistula sufficiently wide open to permit the free passage of sound vibrations and a fistula which may still be partially patent with a positive fistula test but can no longer transmit sound. Of the 930 fenestration operations performed between July 1938 and December 1945, hearing improvement in 53 has been lost to date. Reoperation was carried out in 30, and in every instance the hearing loss was found to be due to new bone closing the fistula, although the fistula test remained positive in some of these, because of a band of fibrous tissue extending through a tiny opening in the new bone from the skin flap to the membranous labyrinth.

In some patients there has been a great initial hearing improvement followed after a few months by a partial recession, but not to the preoperative level. Reoperation in a few of these has revealed in each case an open but narrowed fistula. It is interesting to observe that the hearing in these cases tends to reach a level between the first and second year which is then continuously maintained as a moderate improvement, suggesting that active osteogenesis narrowing the mouth of the fistula has ceased after the second year.

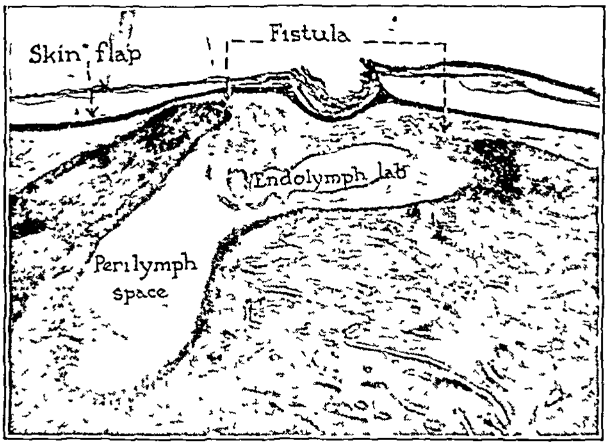

Fig 8 —Ideal fenestra with no osteogenesis at the margins in monkey six weeks after fenestration Note the thin skin flap closely adherent to the margins of the fistula There is complete absence of bone fragments. The fistula is situated at the top of a mound rather than at the bottom of a depression

From these observations we conclude that the functional patency of the fistula to sound can be judged by the hearing improvement as determined by audiometric tests.

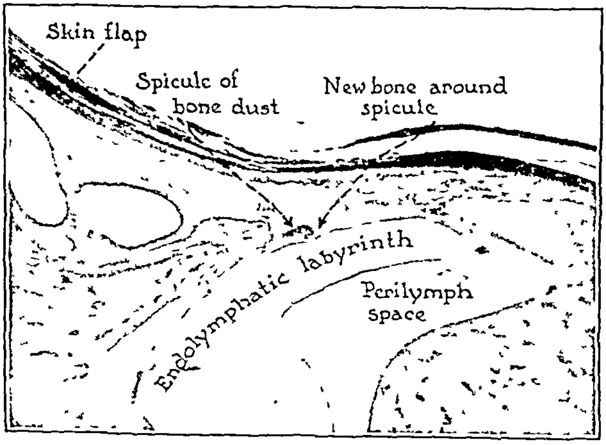

Fig 9 —Osteogenesis around a particle of bone dust narrowing the mouth of the fistula in a monkey three and one half months after fenestration.

In table 1 are analyzed all of my 930 consecutive fenestration operations from July 1938 to December 1945 with respect to the functional patency of the fistula to sound. Observe the decreasing proportion of cases in which hearing improvement was lost as the result of bony closure of the fistula with each major improvement in technic.

In table 2 the 53 fenestras that closed are analyzed according to the time after operation when the hearing reached the preoperative level, indicating complete functional closure. Observe that, of the fistulas that closed, 82 per cent did so within one year after operation. A few fistulas closed between the first and second years, but only 1 fistula closed after two years. Thus 98 per cent of fenestras that closed did so within two years after operation. This is of great significance and importance in considering the permanence of the fistula and the hearing improvement after the fenestration operation, for it means that a patient who maintains his hearing improvement for more than one year after the operation *is likely to retain it, while he who maintains his improvement for more than two years will almost certainly keep it permanently* (fig. 10). It means that osteogenesis tending to close the fistula is less active after the first postoperative year and is completely *inactive as a rule by the end of the second year.* It means finally that in judging the value of any new fenestration technic, such as the cartilaginous "stopple" technic, first described a year ago and *prematurely acclaimed* a few months later in *Hygeia* and the *Reader's Digest,* we must have the audiometric data on at least the one year *and preferably on the two year results* in a consecutive series of cases before we can know that the new technic represents an advantage over previous technics.

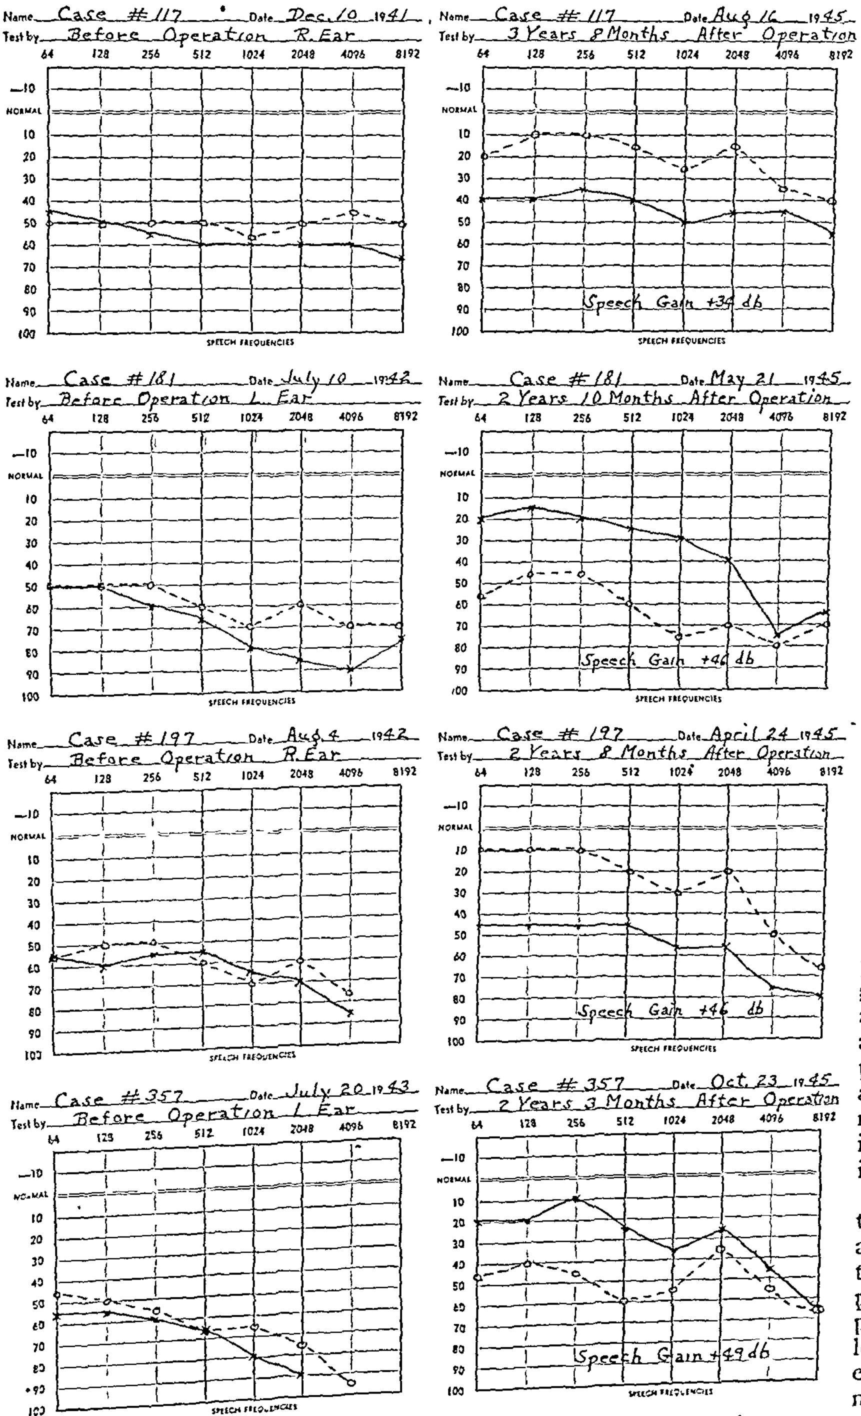

Fig. 10.—Almost certainly permanent hearing improvements two years or more after operation by nov ovalis technic with constant irrigation and microscope: solid line, left ear; broken line, right ear.

Of particular interest are the five year results of the fenestration operation that we are now seeing in considerable numbers (fig. 11). It is significant that the hearing after five years in all of these cases is the same as at the end of two years after operation, affording further proof that *osteogenesis tending to close the fistula as a rule is no longer active two years after operation.*

In table 3 are summarized only the cases in which audiometric tests have been made two years or more after operation and in which hearing results may be regarded as almost certainly permanent. *In the technic used for the past four years, namely the Lempert "nov-ovalis" operation with the addition of the constant irrigating apparatus and the microscope, 92 per cent of the two year results show a permanent hearing improvement.* Not all patients maintained their maximum gain: 4 per cent lost part, but not all, of their improvement, and the average hearing improvement for this 4 per cent is now 21.7 decibels. *The average gain for the 88 per cent that maintained their maximum hearing improvement for more than two years is 28.9 decibels.*

For statistical purposes we classify the results of the fenestration operation according to the decibels gained, but this does not necessarily *measure* the practical value of the operation to the patient. Thus a person with a hearing loss before operation of 40 decibels will experience a *satisfactory* result by a mere 12 or 15 decibel gain, whereas persons with a greater preoperative loss will require a greater gain to regard the operation as worth while. Nor can we judge the operation solely by the postoperative level reached without reference to the preoperative loss, for some of our happiest and most satisfied patients are those with a preoperative loss of 80 or 85 decibels who by gaining 45 or 50 decibels now have a hearing level at 35 or 40 decibels loss. The exact value of the operation to each patient is difficult to measure statistically. For purposes of comparative analysis of results with different technics, the number of decibels gained appears to be the most practical measure.

COMMENT

Experimental and clinical studies of the permanence of the labyrinthine fistula after the fenestration operation indicate that the osteogenesis tending to close the fistula is most active during the first few months after operation, after which the processes of healing approach completion and osteogenesis becomes less and less active. Most of the fistulas that will close do so within the first year after operation. After the second postoperative year all osteogenesis as a rule has ceased and an open fistula with a maintained hearing improvement may be regarded as almost certainly permanent.

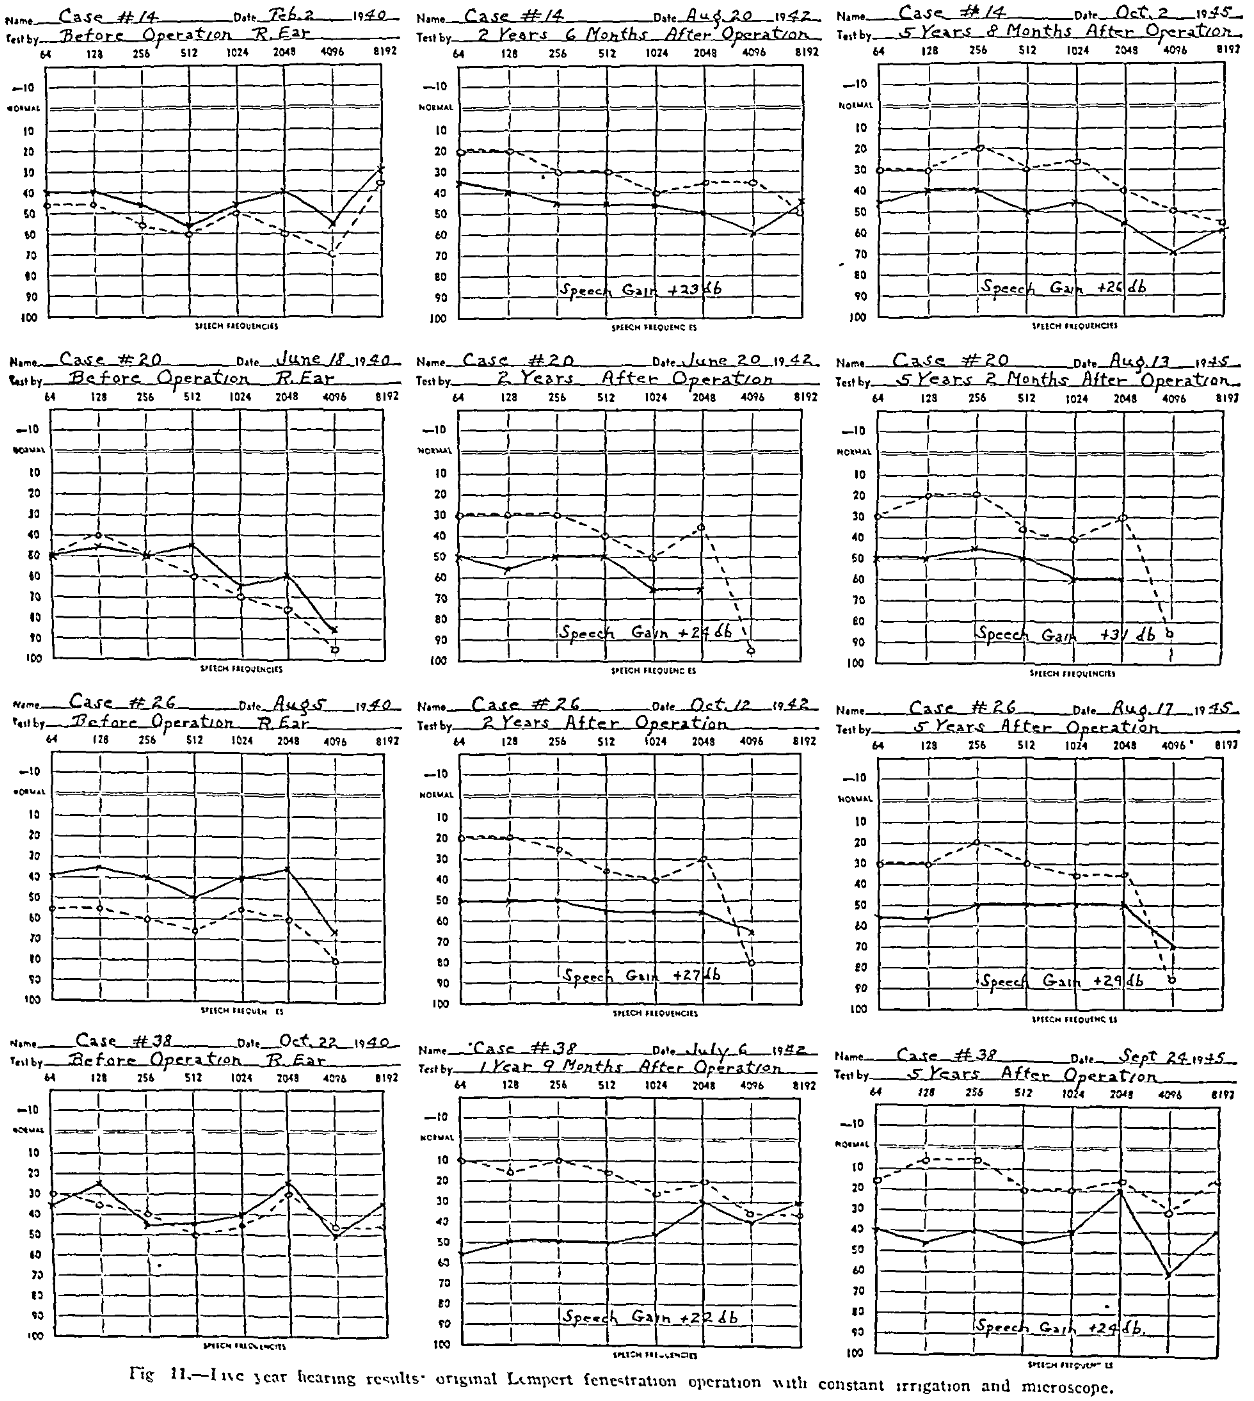

Fig 11.—Five year hearing results: original Lempert fenestration operation with constant irrigation and microscope.

With the technic that I have employed during the past four years bony closures have been reduced to less than 5 per cent after two years. Thus the major cause for failure in the surgical improvement of hearing in otosclerosis has been largely overcome. Nevertheless the results of the fenestration operation still leave much to be desired. Perfectly normal hearing is attained by the operation almost never, though the hearing in many cases is sufficiently close to normal to be regarded as normal by the patient and his friends. In some cases the hearing improvement is not sufficient to be of practical value. There are approximately 5 per cent of patients whose hearing is never improved, is made worse or is even entirely destroyed in the operated ear. For this reason the poorer hearing ear should be chosen for operation. The operation is not without risk: fatalities and serious complications have been reported.

The prospective candidate for the fenestration operation must first be carefully examined to determine his suitability for the procedure. He must be prepared to take the risks and the uncertainties of this purely elective operation. He should also be prepared for the vertigo that always accompanies and follows operative opening of a semicircular canal. As a rule this dizziness promptly subsides, so that the patient is out of bed by the fourth day and walks out of the hospital on the eighth day after operation, but dizziness sufficient to be annoying sometimes persists for many months, the longest in my series being two and one-half years after operation. Finally, the technic of the fenestration operation is as painstaking and delicate as any surgical procedure done on the human being and can be acquired only by careful and extensive cadaver experience.

CONCLUSIONS

Experimental studies on the fenestration operation in the monkey indicate that the following factors govern osteogenesis tending to close the fistula:

1. The sluggish response to trauma of the enchondral layer of the labyrinthine capsule.
2. The inhibiting effect of stratified squamous epithelium on osteogenesis.
3. The stimulating effect of bone dust and fragments on osteogenesis.
4. The stimulating effect on osteogenesis of trauma to the endosteum within the labyrinth.
5. The inhibiting effect on osteogenesis of a smooth polished bone surface.
6. The tendency of the intact membranous labyrinth closely adherent to the skin flap to hold the mouth of the fistula open.

By attention to all of the factors governing osteogenesis, using the "nov-ovalis" fenestration technic with constant irrigation and the microscope, it has been possible for the first time to make a labyrinthine fistula in an experimental animal which has remained open for more than a year. With this technic the closures in the human patients have been reduced to less than 5 per cent after two years.

Clinical analysis of results in 930 consecutive fenestration operations over seven and one-half years indicates that osteogenesis tending to close the fistula is as a rule no longer active two years after operation.

The two year hearing result of the fenestration operation may be regarded as the permanent result.

55 East Washington Street.

Identification and the Postwar World.—There are three interrelated kinds of identification: (1) that of an individual with some other older and more important (or in some other way envied and preferred) person whom the individual in question wants to be like, (2) that of an individual with some whole group which he wants "to love" and "to be loved by," and finally (3) that of an individual with a cause proclaimed by a group.—Tolman, Edward Chace: Identification and the Postwar World, in *Twentieth Century Psychology*, New York, Philosophical Library, 1946.

BRONCHOGENIC CARCINOMA

Diagnosis by Cytologic Study of Bronchoscopically Removed Secretions

PETER A. HERBUT, M.D.
and
LOUIS H. CLERF, M.D.
Philadelphia

Although the technic in thoracic surgery has been perfected to such a degree that at present there is no more risk in performing a thoracotomy than there is in performing a laparotomy, the death rate from carcinoma of the lung is still appallingly high. It appears that the two most important factors responsible for the decrease in curability are the tardiness on the part of the patient in consulting a physician and the delay on the part of the physician in arriving at a correct diagnosis. The former can be decreased only by a more widespread and effective education of the general public to increase the awareness of the gravity of any persistent pulmonary signs and symptoms and by mass periodic roentgen surveys of the lungs. The latter can be reduced by increasing the acuity of the already well established diagnostic procedures or by devising new methods that will aid in making an early diagnosis.

The generally accepted present day methods of diagnosing pulmonary carcinoma consist in a consideration of the signs and symptoms, roentgenography, bronchography, bronchoscopy and microscopic study of tissue obtained endoscopically, at thoracotomy or by direct aspiration of the tumor through the chest wall. Unfortunately significant signs and symptoms are often not present until late in the disease. Roentgenography and bronchography are of great value in making an outright diagnosis when the process is well established and are useful in picking up initial infiltrations but often are of questionable aid in distinguishing early carcinoma from noncancerous pulmonary lesions. Bronchoscopy is undoubtedly the best single procedure for diagnosing lesions present in the trachea, main bronchi or their immediate subdivisions but is of little positive value in diagnosing the more peripheral neoplasms. By this method hilar tumors can be directly visualized and a portion removed for microscopic study, or, if no endobronchial neoplasm is seen, the fixation of the bronchus and surrounding structures offers indirect evidence of the cancer. In either case, however, although a correct diagnosis can be thus established, the lesion has only too often infiltrated such vital structures that successful surgical extirpation is impossible. The only diagnostic procedure, perhaps, that approaches infallibility is the microscopic study of removed tissue. But this too can often be accomplished only when the cancer has progressed beyond the stage of curability. This is certainly true of most cases in which tissue can be removed endoscopically and is likewise true of the cases in which it can be obtained at thoracotomy, for the latter can be accomplished with impunity only when the growth has reached the pleura or mediastinal nodes. Aspiration biopsy, while enthusiastically advocated by some workers,[1] is condemned by others.[2] If an unequivocal diagnosis of carcinoma cannot be made preoperatively, who can say at the time of thoracotomy a small, centrally

placed intrapulmonary lesion (the only stage at which a pulmonary cancer can be cured) is a carcinoma, unresolved or organized pneumonia, an abscess or an anthracotic or silicotic nodule? It appears, therefore, that any innocuous procedure that will aid in establishing an early definitive diagnosis, particularly in the tumors located at the periphery or in the upper lobes, would be of great value in reducing the present high mortality rate. It has been our experience that examination of bronchial secretion for cancer cells offers such an opportunity. At least, we have found this procedure encouraging enough to continue its use, and we hope that it will receive a thorough trial in other clinics.

Sporadic reports of examination of sputum for cancer cells appeared in medical literature as early as the last century.[3] At present, apparently, this method is used with considerable success in countries other than our own. Thus in England[4] positive diagnoses are reported in as high as 68 per cent of cases of bronchogenic carcinoma, in Russia[5] 70 per cent, in Denmark[6] 86 per cent and equally enthusiastic reports have been published in Latin American literature.[7] Although this method has been tried in the United States, it has not been very popular or considered of much value, as witnessed by the following statements: "Only exceptionally may the diagnosis be made from a study of the cytology of the sputum."[8] "The pathologist may on rare occasions make a diagnosis from fragments of tumor discovered in the sputum."[3] "Rarely portions of growth are expectorated and can be submitted to microscopy."[9] "Little valuable information was obtained."[10] "With exception of the 2 cases (in a series of 175) just mentioned there has been no case in which the examination of the sputum has revealed tumor cells"[1] "Sometimes fragments of tumor tissue acceptable for diagnostic purposes are obtained by bronchial aspiration."[11] "It has been of value in a few of our cases."[2]

The finding of tubercle bacilli in bronchial secretions of many cases in our clinic when they could not be found in the sputum, the frequency with which cancer cells are found in histologic sections of the bronchioles and bronchi in both primary[12] and secondary[13] pulmonary carcinoma, the encouraging reports of the presence of cancer cells in sputum just referred to and the excellent results obtained by examining vaginal smears for cancer cells in carcinoma of the cervix and uterus[14] led us to examine bronchial secretions for tumor cells. We chose bronchial secretion rather than sputum, for while the advantage of the latter method over the former lies solely in the ease with which the respective material is obtained this precedence loses its importance when, as will be seen subsequently, the results of the two methods are compared. Sputum is more dilute than are bronchial secretions, and so the chances of finding cancer cells are considerably diminished. Furthermore, expectoration of sputum does not occur until late in the disease, at which time a diagnosis can be easily made by other means. Bronchoscopy, on the other hand, is performed routinely in all modern clinics in every case of suspected pulmonary carcinoma. If during this procedure the trachea and bronchi are filled with secretions these can be aspirated and discarded and only those secretions which come from the region of the suspected tumor sent to the laboratory for examination. This material is more likely to contain cancer cells than are the more dilute secretions found in the trachea and the even more dilute sputum. Furthermore, in those cases in which there is no expectoration of sputum there is usually some secretion in the trachea and bronchi which can be aspirated during bronchoscopy and sent to the laboratory for study. For these reasons we believe that examination of bronchial secretions for neoplastic cells is superior to examination of sputum.

MATERIAL AND METHOD

Initially bronchial secretions were obtained from several cadavers of persons known to have had bronchogenic carcinoma prior to autopsy. The sternum and heart were removed in the usual manner; all the blood and serum were carefully mopped away, and the trachea and bronchi were exposed in situ without any undue manipulation and with care that the incisions were not carried through tumor tissue. The exact location of the primary tumor having been told beforehand, the secretions just proximal to this site were aspirated without touching the mucosa or the tumor. Then a small portion of the solid tumor was removed from which both histologic sections and smears were made, the latter being stained simultaneously with smears of the bronchial secretions.

After several such cases were studied and we were familiar with the appearance of cancer cells in smears, we studied secretions obtained at bronchoscopy from a variety of inflammatory pulmonary lesions and from patients suspected of having bronchogenic carcinoma. In the latter groups, as already indicated, when the trachea and bronchi contained an abundant amount of secretion this was first aspirated and discarded and only that sent to the laboratory which came from the region of the suspected tumor. When the secretions were scanty, everything that could be obtained by aspiration was saved In cases in which a tumor was visualized endoscopically it was made certain that the neoplasm was not traumatized with the bronchoscope in order that only spontaneously sloughed material might be examined. The aspirator was washed with a small quantity of saline solution only when the amount of secretion was too scanty to reach the collector. As soon as the material was obtained it was sent to the laboratory, where smears were made immediately and, while still wet, were fixed in equal parts of 95 per cent alcohol and ether and stained by the Papanicolaou technic.[14]

When the amount of material obtained was small, all was removed from the collector and smeared, but when the amount was greater than could be utilized it was first poured into a petri dish, placed on a black background and only those portions that resembled bits of sloughed tissue, or that were streaked with blood, were smeared. All sputums secured from patients with positive bronchial smears were treated in the latter manner. At first thick smears were made, but it soon became apparent that thinner ones were more valuable, for in these all cells could be adequately studied. In preparing the smears the material was placed in the center of the slide and gently crushed with another slide, care being taken that any granules which may have been present did not escape peripherally. At first one or two smears were made from each specimen, but because of the inequality of the distribution of cancer cells an arbitrary figure of five smears from each secretion was later adopted, and in a few instances as many as fifteen smears were prepared. Every portion of each slide was methodically examined and an unbiased objective report was submitted, usually on the same day the specimen was received, without any knowledge of the clinical findings except of course on cases studied at postmortem.

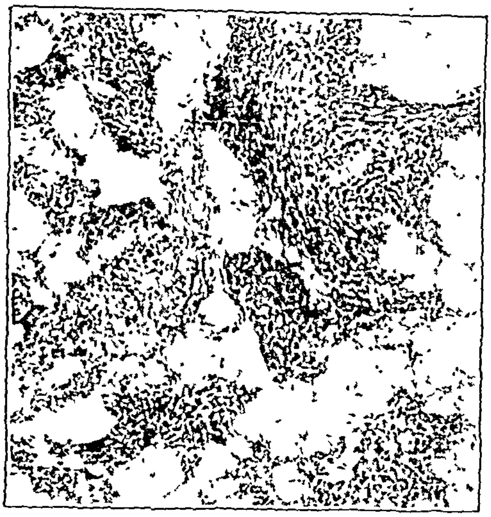

Fig. 1.—Smear of secretions removed endoscopically from a proved case of carcinoma showing four large pieces of tumor in squamous cell formation. The cells stain from pink to orange. Papanicolaou stain × 100.

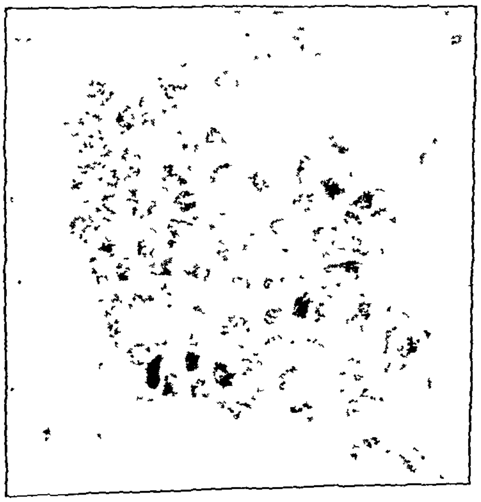

Fig 2.—A group of neoplastic cells in squamous formation removed endoscopically from another case of proved bronchogenic carcinoma. The cells are more compact and the nuclei are more irregular and relatively smaller than are those of noncancerous intermediary epithelium shown in figure 12. The cytoplasm of the cells illustrated in figure 2 stains pink to orange, whereas that shown in figure 12 stains a bluish green. Papanicolaou stain × 400

RESULTS

There were a total of 106 separate examinations in 83 different cases. Of the 106 specimens submitted 7 were sputums and 99 were bronchial secretions. Initially in the entire group of 83 cases there were 23 cases in which cancer was not suspected and which consisted of bronchiectasis, bronchitis and asthma. These were used deliberately as controls in order to become acquainted with the various cells seen in different pathologic processes. To this group were added 18 other cases in which clinical data were merely suggestive of carcinoma but which later proved to be noncancerous. There were 42 cases with sufficient clinical evidence to be seriously considered as carcinoma, and of this group 38 were subsequently proved to be cancer by obtaining tissue bronchoscopically, at thoracotomy, at biopsy of metastatic nodules, at necropsy or by death with obvious metastasis. In the entire group of 38 cases secretions were positive for cancer cells in 30 cases, or 79 per cent. In 8 of these 38 cases bronchial secretions were obtained at postmortem only, and in 30 cases they were obtained bronchoscopically during life. In this group of 30 cases cancer cells were present in the secretions of 22, or 73 per cent, while in the same group of cases a histologic diagnosis of carcinoma was made from tissue removed endoscopically in 11 cases, or 36 per cent. There were, however, 7 other cases in which there was fixation of a bronchus and surrounding tissue, making a total of 18 cases, or 60 per cent, in which there was a positive bronchoscopic examination. Cancer cells were present in the secretions in all cases but 1 in which tissue could be removed endoscopically, and the failure in this case rests entirely with the technic, since it was one of the first examined. All cases except 2 in which a positive bronchoscopic examination was made but in which tissue could not be obtained endoscopically showed cancer cells in bronchial secretions. In 1 of these the amount of secretion submitted for examination was inadequate and in the other the flora was that of carcinoma but definite tumor cells could not

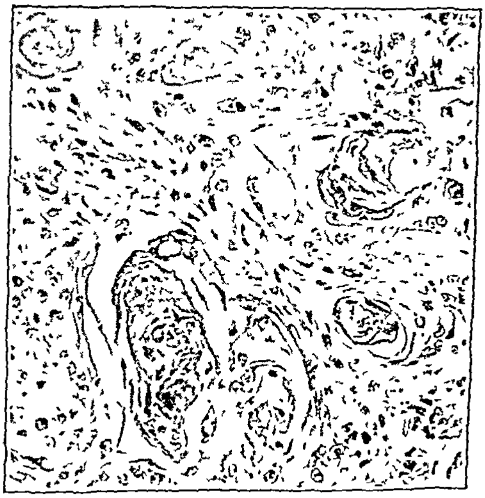

Fig 3.—Section of tissue removed endoscopically from a case of bronchogenic carcinoma showing a mass of irregular squamous epithelium in which there is abundant pearl formation. Hematoxylin and eosin × 100.

be found. There were thus 7 cases in which bronchoscopy was entirely negative and in which neoplastic cells were found in the bronchial secretions. Seven examinations of sputum were performed in 5 cases with positive bronchial secretions, and in only 1 of these 7 specimens were cancer cells demonstrated. Although it is hardly permissible to speak of percentages when the entire series of cases is as yet so small, we have nevertheless included them because they do show the trend and we are confident that as our experience increases the figures will be even better.

PATHOLOGY

Macroscopic.—It is of course common knowledge that the appearance and consistency of bronchial secretions vary with the nature of the underlying disease process. In all our cases in which cancer cells were found the secretions were, however, quite characteristic although not necessarily pathognomonic. The amount varied from a few drops to 4 cc. The color ranged from gray and watery to somewhat creamy and opaque, but invariably it was either streaked with or diffusely mixed with bright red, pink or dark brown partially disintegrated blood. It was always tenacious and adhered closely to the side of the collector and glass slide. Sometimes it was heavy, but at other times it contained bubbles of air or was even somewhat frothy. In only 1 instance out of the entire 38 positive examinations was there perceptible a tiny granule less than 1 mm. in diameter which when crushed was found to consist of cancer tissue. It should be noted, however, that blood tinged secretions are not always indicative of cancer, for in this series there were several such specimens in which neoplastic cells could not be found.

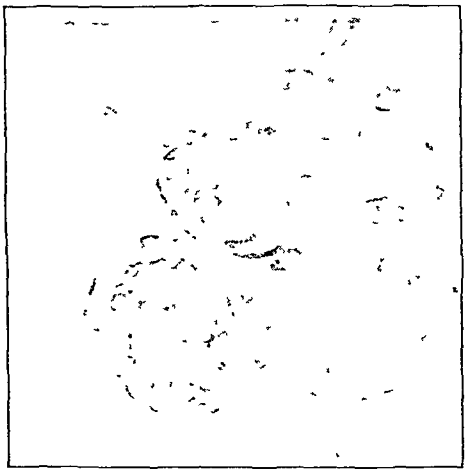

Fig. 4—Smear of bronchial secretions from the same case shown in figure 3 illustrating epithelial cells in pearl formation. Papanicolaou stain × 400.

Microscopic.—Noncancerous Flora: It is almost superfluous to mention that one must first become thoroughly familiar with the noncancerous elements in bronchial secretions. Since all patients undergoing bronchoscopy have some pulmonary disease, one can always expect to find leukocytic cells. The most commonly encountered and readily recognized are polymorphonuclear leukocytes (fig. 11). They differ from those in blood smears only in that, with the staining method employed, their cytoplasm appears light green. Lymphocytes as always are small, round and uniform and contain a scanty amount of light green cytoplasm. Plasma cells are present in varying numbers and show eccentric nuclei and well defined abundant light green staining cytoplasm. Mononuclear phagocytes are sometimes scanty but at other times are numerous. They vary in size from about 10 microns to 30 microns or more. Their cytoplasm is always abundant, is sharply defined, stains light green and frequently contains carbon or other phagocytosed material. Their nuclei are relatively small, round, evenly stained and central or eccentric in position. Accompanying the leukocytes there are always present varying amounts of blue- to green granular precipitate and fibrin.

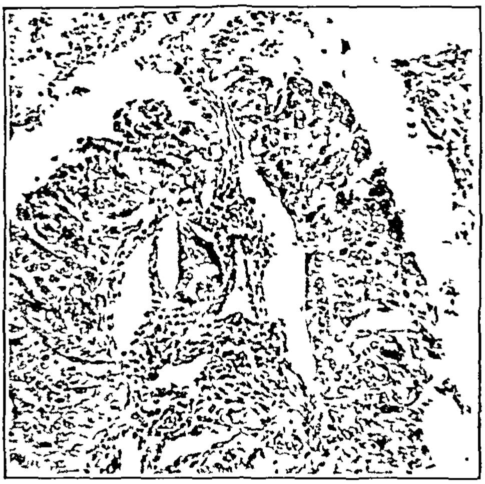

Fig. 5—Section from a case of bronchogenic carcinoma obtained at necropsy showing groups of neoplastic cells partly differentiated into squamous cells but without keratinization or pearl formation. Hematoxylin and eosin × 100

Every bronchial secretion contains sloughed epithelial cells which ordinarily can be readily recognized as noncancerous. In sputum one finds large, polygonal, sharply defined, pavement cells with relatively small round evenly stained nuclei. Their cytoplasm stains pink orange, yellow, blue or green and the cells are found either singly or in groups of a dozen or more. Occasionally a few of these cells are also found in nonneoplastic bronchial secretions, where they probably arrived by aspiration from the upper air passages.

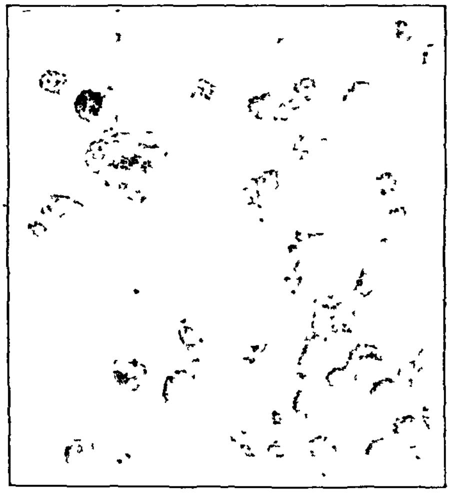

Fig. 6—Smear of tumor from the same case illustrated in figure 5 showing a group of cancer cells of varying shapes and sizes. The nuclear membrane is quite distinct and the nucleoplasm is somewhat "washed out" and clumped. The cytoplasm is relatively scanty. Papanicolaou stain × 400

Ciliated columnar epithelial cells are almost never absent (fig. 11). Ordinarily single cells are easily recognized by their long slender shape with often a pointed base, a central round oval evenly stained nucleus, abundant light green cytoplasm and a broad sharply defined inner border often covered with numerous cilia. When these cells undergo degeneration their outlines break; the cytoplasm becomes irregular and frayed, and the nuclei become swollen, rounded and faintly stained (fig. 11). Sometimes columnar cells appear in dense clusters and superficially resemble groups of stratified squamous epithelial cells, but if there is one such group of cells present there are usually others, and in the less densely packed areas their true outlines often covered with cilia can be discerned. Cuboidal cells with or without cilia are similar to columnar cells, with the exception that they frequently contain vacuoles. Single or small groups of cells, probably derived from the intermediary layers of the epithelium, are not uncommonly present and are important to recognize as such (fig. 12). They are of moderate size, round, oval or polygonal, have sharply defined outlines, blue to green or gray cytoplasm and relatively large, round or oval evenly stained nuclei A few peripheral cells may occasionally contain cilia. Basal cells are least frequently encountered. They resemble somewhat lymphocytes with the exception that they are two or three times as large. Their nuclei are uniform, round or oval, are evenly stained and occupy most of the cell. Their cytoplasm is scanty and stains light green.

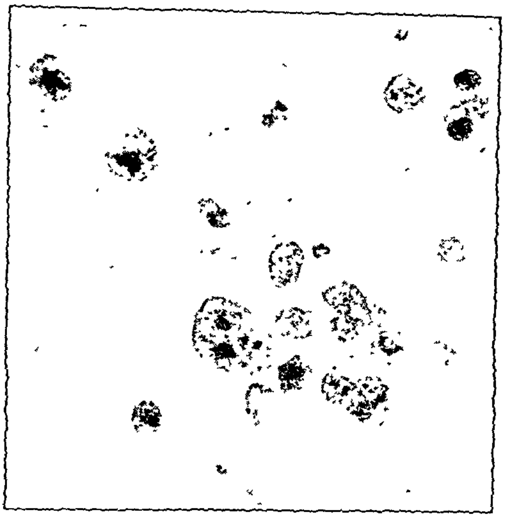

Fig. 7.—Smear of bronchial secretions from the same case illustrated in figure 5 showing tumor cells identical with those seen in figure 6. *Papanicolaou stain* × 400.

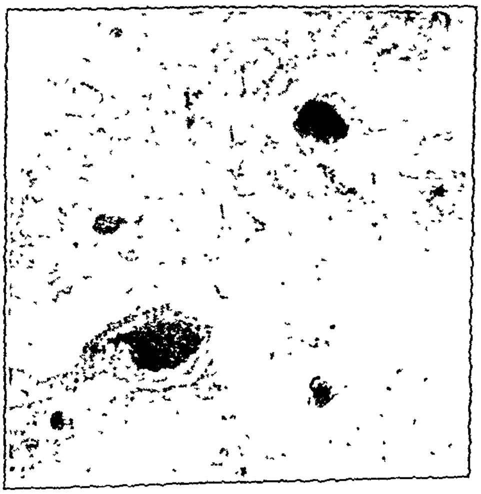

Fig. 8.—Smear of secretions obtained endoscopically from a case of proved moderately well differentiated bronchogenic carcinoma showing two cancer cells. The cytoplasm stains a foggy bluish gray, the nuclear cytoplasmic ratio is increased and the nuclei are extremely hyperchromatic. *Papanicolaou stain* × 400.

Cancerous Flora: Although there is no flora in secretions containing cancer cells that is pathognomonic for pulmonary carcinoma there is nevertheless a certain appearance, difficult to describe precisely, but which gives one the impression that the preparation should contain cancer cells. In such slides leukocytic elements, including fibrin, are usually in abeyance or entirely absent. This is particularly true of the macrophages. Our experience so far has been that, when these are numerous, cancer cells are not found. Because of the absence or decreased amount of fibrin the slides, except for varying amounts of greenish stained precipitate, appear "cleaner" than do those for instance from bronchiectatic cases. Pavement cells, most of which take an orange stain, are often increased in secretions containing cancer cells when the tumor is of a squamous cell variety. Finally, in cancerous secretion erythrocytes are usually fairly abundant.

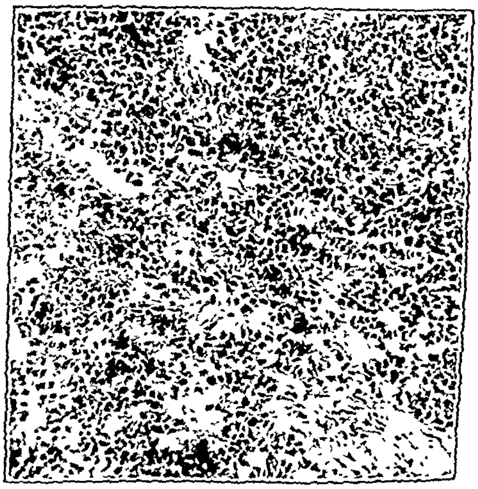

Fig. 9.—Section of tissue from a case of bronchogenic carcinoma of an "oat cell" variety obtained at necropsy. Hematoxylin and eosin × 100.

Cancer Cells: So far we have been able to recognize the following three more or less separate groups of cancer cells in bronchial secretions: (1) clusters of cells which are present in squamous cell carcinoma, (2) large irregular single cells found in the more dedifferentiated tumors and in those with an adenomatous formation and (3) smaller more uniform cells present in the so-called oat cell carcinoma.

In squamous cell carcinoma there are usually small or large pieces of stratified squamous epithelium evenly distributed throughout all slides or present only in one portion of one slide (figs. 1 and 2). If they happened to have been crushed at right angles to the surface one can see the keratinizing cells on the surface, the intermediate prickle cells and even the basal cells. Usually, however, they are seen as a mass of closely packed, relatively large cells whose cytoplasm stains an orange red and whose nuclei are large and dark blue. Cilia are never present. At the periphery there are usually encountered a few detached single cancer cells. They have an abundant amount of blue green to gray, ill defined, peripherally frayed cytoplasm and relatively large, round, oval or slightly irregular deeply stained nuclei. These cells are quite well differentiated and so do not appear as "wild" as do the cells of the more anaplastic tumors to be described presently. Occasionally when there is abundant pearl formation in the original tumor one finds naked pearls within the bronchial secretions (figs. 3 and 4). They are similar to those seen in ordinary histologic sections and consist of whorls of closely packed cells with deep staining, elongated, pyknotic nuclei and bluish green to gray cytoplasm.

When the tumor is less well differentiated, in adenomatous formation or a combination of the two, single cancer cells are found in the secretions (figs. 5, 6, 7 and 8). As would be expected they vary tremendously in size, shape and staining qualities. They are invariably considerably larger than normal cells (sometimes of giant proportions) and assume anything but the regular configurations described. Their borders are almost always ill defined, frayed and fuzzy. The cytoplasm stains bluish green, blue or gray and although absolutely increased it is relatively decreased and sometimes almost entirely imperceptible. The nuclear-cytoplasmic ratio is thus always increased over the normal. While theoretically some of the cells should be vacuolated, this appearance we have not yet encountered. The nuclei are single or multiple and usually are extremely bizarre. Whereas they may be round or oval they ordinarily form irregular, coiled, folded, hexagonal or dumb-bell shaped configurations. Some of the larger and more regular appearing nuclei show a very sharp, deeply stained, peripheral membrane which encloses lightly stained somewhat washed out and clumped nucleoplasm. Other nuclei are solid and so hyperchromatic that the internal structure is not discernible. Nucleoli are not always demonstrable but, when present, they are easily recognizable as round or slightly oval, sharply circumscribed bodies stained either lighter or heavier than the surrounding nucleoplasm. Often as many as four can be seen within a single nucleus.

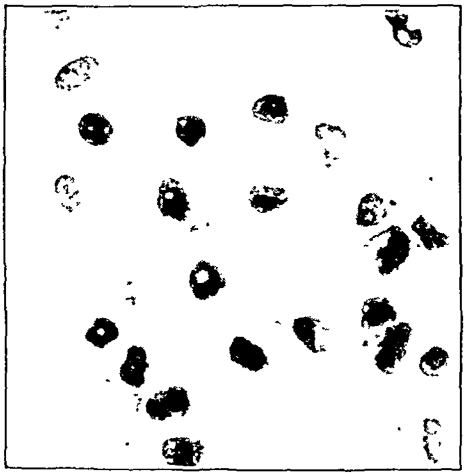

Fig. 10.—Smear of tumor from the same case illustrated in figure 9 showing numerous anaplastic cancer cells. They contain practically no cytoplasm and deeply stained irregularly shaped nuclei. Note the presence of one or more nucleoli within a single nucleus Papanicolaou stain X 400.

As compared with the foregoing cells, neoplastic cells derived from the so-called oat cell carcinoma are relatively small (figs. 9, 10 and 11). They are round, oval or slightly irregular, contain a scanty amount of blue to green cytoplasm and possess round, oval or somewhat irregular, sharply defined, deeply stained single nuclei. They are best identified by their size and by the fact that although the cells are similar there are definite variations in the shape of the nuclei from cell to cell.

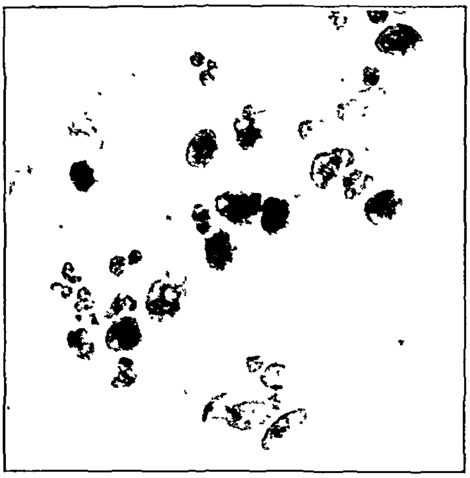

Fig. 11.—Smear of bronchial secretions obtained from the same case illustrated in figure 9. There are ten cancer cells identical with those shown in figure 10. There are present also a few polymorphonuclear leukocytes, one normal columnar epithelial cell with cilia, and two partly degenerated columnar epithelial cells in the lower portion of the photomicrograph. Papanicolaou stain X 400.

COMMENT

In our description of the cytology of bronchial secretions we have allotted almost as much space to normal cells as we have to cancer cells, for it is obvious that without a thorough knowledge of the normal flora one cannot begin to understand the abnormal. Having acquainted oneself with the elements that may be present in the secretions in various disease processes, a diagnosis of carcinoma can be made on finding a single cancer cell. Sometimes it is necessary to search several slides before one such cell is found, and for this reason we have chosen an arbitrary number of five slides from each secretion as the minimum. Usually, however, if there is one cancer cell present there are also others.

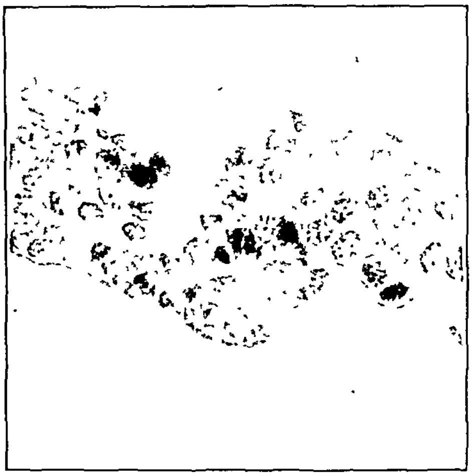

Fig. 12.—Smear of bronchial secretions removed endoscopically from a case of pulmonary tuberculosis showing a group of noncancerous intermediary cells as compared with cancer cells seen in figure 2. They are loosely united and contain large evenly stained nuclei and a relatively small amount of cytoplasm that stains bluish green. Papanicolaou stain X 400.

Bearing in mind the fact that carcinoma of the lung is extremely pleomorphic, the primary tumor in a bronchus or bronchiole is nevertheless most frequently of a squamous cell variety. That this is so is fortunate, first, because such neoplasms grow more slowly than do ones composed of the more anaplastic elements and, second, because in bronchial secretions cells derived from a squamous cell carcinoma are easy to recognize. As would be expected, the cells in such a neoplasm are quite well differentiated and so approach those of normal squamous epithelium. Thus although groups of these cells may look innocent enough, when they are found in bronchial secretions an unequivocal diagnosis of squamous cell carcinoma can be made simply because they are not present in this material under any other circumstances. One must make certain, however, that they are squamous cells and not clumps of cells derived from the intermediate layers of the epithelium or dense aggregations of columnar cells. The former can be distinguished by their staining qualities. Cancerous squamous cells stain pink or orange, while the intermediary cells stain green to blue. Also in the former the different layers can often be discerned, whereas in the latter the cells are more or less uniform in shape and size without stratification. Solid collections of columnar cells are identified by the fact that at the periphery of the clumps there are usually a few cells whose true outline can be traced and by the fact that with fine focusing of the microscope cilia can usually be seen. And it can be stated as axiomatic that any cell or groups of cells bearing cilia are not cancerous.

When bizarre single cells are encountered there is no question of the process being cancerous. Sometimes the neoplastic cells are not quite so irregular and may at times be confused with other cells. With experience, however, a differentiation can ordinarily be made. If one is in doubt as to whether a cell or group of cells are cancerous, the chances are that they are innocent. Lymphocytes, basal cells and macrophages may be confused with cells from an oat cell type of carcinoma. The latter should, however, be distinguishable by their size, deep staining quality, and always the slight but definite variation in the shape of the nucleus from cell to cell. Lymphocytes are considerably smaller, and basal cells, although often of the same size, stain more evenly and less intensely, and the individual cells are more uniform in shape and size. Macrophages should not be difficult to differentiate, for there are usually neighboring cells of exactly the same morphology that contain carbon or other pigment. Pavement cells of course are easily recognized. Their increase in the flora of cases with squamous cell carcinoma can be accounted for, not by aspiration from the upper air passages but by the sloughing of the keratinized neoplastic cells themselves.

The method of examination of bronchial secretions for cancer cells is presented not with the idea of finding a substitute for the already well established and highly efficient methods used in the diagnosis of pulmonary carcinoma but as an adjunct to be used in conjunction with these methods. It is apparent that sometimes this is the only way in which cancer cells can actually be demonstrated, and unless one can see the neoplastic cells a diagnosis of cancer is never fool proof. Certainly, if a competent cytologist makes a positive diagnosis of pulmonary carcinoma from cells in bronchial secretions, the surgeon can proceed with the operation with as much impunity as he does when the diagnosis is made from a study of a histologic section of tissue removed at biopsy. By the method outlined it is hoped that central, peripheral or upper lobe pulmonary neoplasms will be diagnosed at the time of the first bronchoscopy without losing a valuable month or two waiting for an x-ray shadow to increase or decrease in intensity in order to be certain that a lesion is or is not neoplastic. By that time it might be too late.

SUMMARY

In 30 consecutive cases of primary pulmonary carcinoma, bronchial secretions were stained by the Papanicolaou technic. Cancer cells were demonstrated in 22 cases, or 73 per cent. In the same series a positive morphologic diagnosis, from a study of tissue removed endoscopically, was obtained in 11 cases, or 36 per cent. Cancer cells were present in the secretions from 7 cases in which bronchoscopy was negative.

Sputums were examined from 5 cases in which cancer cells were present in bronchial secretions, and in only 1 of these were neoplastic cells found. We therefore believe that examination of bronchial secretions for tumor cells is superior to examination of sputum.

The method is presented not as a substitute for but as an adjunct to the means already employed in the diagnosis of pulmonary carcinoma. It is particularly useful in cases in which the tumor is located at the periphery of the lung or in the upper lobe.

Clinical Notes, Suggestions and New Instruments

TOXIC PHENOBARBITAL REACTION COMPLICATING MYOCARDIAL INFARCTION

SIGMUND S. WINTON, Ph.D., M.D.
Chicago

Since the introduction of phenobarbital in medical practice in 1911 reports have appeared in the literature warning that the use of this drug is not attended entirely without danger. Considering its popularity as a sedative, hypnotic and anticonvulsant, the reports on its toxicity have indeed been relatively few. The reason for this meager literature on the subject is the fact that many of the mild reactions have been overlooked or unreported, and in the more toxic reactions often no association between the severe constitutional upset and a chemical rash has been suspected. Furthermore, recognition of a toxic manifestation is difficult, since often the patient fails to give a history of barbiturate sensitivity; the character of the rash and its distribution are not specific, and the various tests suggested by some workers[1] have failed in many instances to prove the presence of drug sensitivity in such patients.[2]

In 1912 Loewe[3] reported 3 cases of phenobarbital toxicity, describing a generalized cutaneous eruption without systemic reaction and disappearance of the rash on withdrawal of the drug. In contrast to such relatively mild reactions and uneventful recoveries, deaths following severe manifestations of phenobarbital toxicity when therapeutic doses were employed have been reported.[4]

Dr. Maurice Oppenheimer (dermatologist) confirmed the diagnosis in this case.

2. Novy, F. G.: Drug Eruption Due to the Barbiturates, California & West. Med. 48: 324 (May) 1938. Hull, B. P.: Hypersusceptibility to Basal Anesthetics, Brit. M. J. 2: 1199 (Dec. 10) 1938. Moss and Long.[6]

3. Loewe, S.: Klinische Erfahrungen mit Luminal, Deutsche med. Wchnschr. 38: 947 (April) 1912.

4. Sexton, D. L.; Pike, G. M., and Nielson, A.: Exfoliative Dermatitis and Death Due to Phenobarbital, J. A. M. A. 116: 700 (Feb. 22) 1941. Chavany and Vannier.[9] Wile and Benson.[7] Poole.[8] Winer and Baer.[11] Scarlet and Macnab.[10] Hueber.[12]

The present case report reemphasizes the fact that phenobarbital medication in therapeutic doses may be attended with some danger of drug reaction and of possible fatal outcome. Despite a severe toxic phenobarbital reaction in the presence of a recent myocardial infarction, the patient survived. A review of the literature reveals that in the majority of fatal cases bronchopneumonia was the cardinal finding at necropsy. In the present case bronchopneumonia was recognized early and treated with large doses of penicillin.

REPORT OF CASE

H. S., a white man aged 61, seen Sept. 20, 1944, was complaining of progressive dyspnea, fatigue and precordial pain on exertion. His appetite was good. There was no weight loss and no change in bowel or urinary habits. An electrocardiogram taken at that time was normal, and other laboratory tests were within accepted normal limits. There were no psychosomatic factors present in his history to explain the symptoms. On the basis of his age and symptoms a diagnosis of chronic coronary insufficiency was made, and the patient was treated conservatively with increasing rest periods, aminophylline 0.195 Gm. (3 grains) four times daily and glyceryl trinitate 0.43 mg. (1/150 grain) as conditions indicated. He carried on with his work in a limited way quite comfortably and with few symptoms. He was not seen for six months prior to Aug. 21, 1945, when he presented new and striking changes.

He stated that three days previously he had been awakened in the early morning with a sharp pain in the middle of his chest. The pain was at first excruciating in character, then became less intense and radiated across his chest and up to his jaw but not down his arms. He remained in bed for several hours until the pain subsided a little and returned to his work. The dyspnea and fatigue caused by standing on his feet forced him to lie down for several hours at a time. He continued working in this way for three days and finally came in for advice.

On examination he appeared pale and mildly dyspneic. His pulse rate was 100 per minute, regular and of poor quality; blood pressure was 130/80, temperature 99.8 F. and respiratory rate 25 per minute. There was neither cervical venous engorgement, peripheral edema nor enlargement of the liver. The bases of the lungs presented a few moist rales. The heart tones were regular and faint. There was no friction rub and no cardiac enlargement to percussion. An electrocardiogram taken immediately showed the presence of a typical posterior wall infarct.

The patient was placed on the usual conservative treatment under the care of a trained nurse, who was instructed to massage his extremities and administer mild passive exercise twice daily. Papaverine 0.130 Gm. (2 grains) four times daily and phenobarbital 0.016 Gm. (1/4 grain) three times daily were the only drugs used. After twenty-four hours of complete bed rest the pulse dropped to 85 beats per minute, the respirations to 18, and the rales in his lungs disappeared. Blood pressure and temperature remained unaltered. Two days later he became restless and the phenobarbital was increased to 0.032 Gm. (1/2 grain) per dose. For the succeeding three weeks he was progressing very well, and apart from the electrocardiogram showing a healing myocardial infarct all other signs had disappeared. At this time the nurse reported the appearance of several small macular spots on his abdomen and renewed restlessness. Examination of the rash showed several discrete oval erythematous macules blanching on pressure. His temperature had risen to 100 F., the pulse rate to 95 and the respiratory rate to 25 per minute. Since the appearance of the rash suggested a drug reaction, phenobarbital was discontinued and fluids were moderately increased. Careful questioning elicited a vague history of phenobarbital sensitivity some years before.

Late the same evening the patient's face became swollen; his eyelids were edematous and were stuck together by a thick, purulent exudate. There was a severe conjunctivitis and corneal injection. The rash had spread over his entire chest and the extensor surfaces of his arms and legs as well as the palms of his hands and soles of his feet. The next morning his entire body, including his bald scalp and the external canals of his ears, was covered with the rash, which now became dark red and hemorrhagic in appearance. His lips became intensely swollen and cyanotic, the tongue was beefy red and painful, the buccal membranes and pharynx were edematous and covered with several small areas of dirty gray exudate, and there was a profuse, bloody discharge exuding from the mouth. There was no cervical adenopathy, and neither spleen nor liver was palpable. His temperature had risen to 104 F., pulse rate to 100 and respiratory rate to 28. He was very restless and complained of inability to swallow water.

The patient was admitted to the hospital, where he was immediately given 5 per cent glucose intravenously because of his dehydration and toxemia. In view of the severe eye and oral inflammation as well as a high white blood cell count and a high polymorphonuclear count in the differential, intensive penicillin treatment was started with the intravenous fluid; 2,000 cc. of 5 per cent glucose was given in twenty-four hours, to which 100,000 units of sodium penicillin was added. In addition to this he received 25,000 units of penicillin intramuscularly every three hours. On admission urinalysis revealed specific gravity 1.022, albumin and sugar absent, 6 to 8 white blood cells and 4 to 5 red blood cells per high power field; there were no casts. Red blood cells numbered 4.45 million, white blood cells 14,750, hemoglobin 85 per cent, polymorphonuclears 82 per cent, lymphocytes 17 per cent, basophils 1 per cent. The platelet count was 200,000, the sedimentation rate 25 (Westergren method). The Kahn reaction was negative. Throat cultures showed a few diphtheroids, staphylococci and diplococci. Blood culture was sterile.

The temperature was 103.4 F., pulse rate 96 and respiratory rate 30 per minute. The treatment for the succeeding forty-eight hours consisted in administering intravenous 5 per cent glucose in saline solution (2,000 cc. in twenty-four hours) with penicillin therapy as mentioned. The patient's eyes were treated with warm, moist boric acid compresses; the buccal membranes were swabbed with 3 per cent hydrogen peroxide; a gargle of 1:10,000 potassium permanganate solution and gentian violet 1 per cent was applied to the raw surfaces of the lips. Vitamin B complex and 100 mg. of ascorbic acid were given intramuscularly daily. In twenty-four hours the temperature dropped to 102 F. but returned to 103.4 F. by the next day. Penicillin was discontinued and the patient was treated symptomatically only.

The general clinical condition at this time appeared worse; the rash became hemorrhagic, hemorrhagic bullae appeared around the nipples and the lips became more swollen, almost grotesque in appearance, with large desquamated, bleeding areas. The urine showed an increase in red blood cells. By the fourth day of hospitalization the patient felt a little better, although his temperature was 101.8 F., pulse rate 96 and respiratory rate 25. He was now able to take water and nourishing fluids by mouth. By the sixth day the temperature had dropped to 98.6 F., pulse rate 88 and respiratory rate 20. The urine showed only 1 red blood cell and 2 to 3 white blood cells per high power field. The white blood cell count had steadily dropped to 6,000, with 66 per cent polymorphonuclears, 33 per cent lymphocytes and 1 eosinophil. The lips and oral cavity showed improvement, and the rash became brownish in appearance. By the seventh day, however, the patient took a turn for the worse. His temperature began to rise, and examination of his lungs revealed scattered areas of crackling rales with areas of dulness to percussion. He was again placed on penicillin 25,000 units every three hours for two days. His temperature quickly returned to normal and all chest signs disappeared. The course of his illness became uneventful thereafter. Temperature, pulse and respiration remained normal. All urinary abnormalities disappeared. The rash and edema disappeared from his face and scalp; his ears and lips assumed a normal appearance. After one month the patient was able to get out of bed for short periods and the electrocardiogram showed evidence of complete restitution.

During his entire severe illness resulting from the phenobarbital reaction there had been no serious alteration in his cardiac condition. Nine weeks from the time the infarct first developed the patient was able to take limited exercise, such as short walks, without exhibiting signs of cardiac insufficiency. Only a fading, brownish, desquamating pigmentation was visible on his abdomen at this time.

COMMENT

It has been roughly estimated that from 1 to 3 per cent of persons taking therapeutic doses of phenobarbital develop a toxic reaction of varying severity.[5] The majority of these patients show a sensitizing reaction characterized by urticarial wheals, itch and disappearance of the cutaneous manifestations on withdrawal of the drug. A relatively smaller group develop toxemia associated either with severe cerebral symptoms[6] or with an erythematous macular rash which may disappear after a variable period or end with terminal bronchopneumonia and death.[7]

Of the various types of toxic skin manifestations reported in the literature, the most commonly encountered is the erythematous maculopapular rash ending in exfoliation. This type was first described by Hamilton, Geiger and Roth[8] in 1926. Of the 41 cases collected by Menninger[5] up to 1928 the majority developed this type of cutaneous eruption and, following a protracted period of illness, all survived. In 1929 Chavany and Vannier[9] reported the first 2 deaths attributable to phenobarbital intolerance. In both cases a generalized exfoliative dermatitis and severe toxemia were described. Scarlet and Macnab,[10] in a systematic search of the literature up to 1935, listed 408 deaths as being due to barbiturate poisoning, of which only 6 were caused by phenobarbital taken in therapeutic doses. Since this survey was made, other cases of exfoliative dermatitis with fatal outcome have been reported.[11]

A less common type of toxic cutaneous eruption is the hemorrhagic rash first described by Heuber[12] in 1919, later by Haxthausen[13] and more recently by Moss and Long.[14]

Following administration of the drug, reactions may appear as early as twenty-four hours[6] or as late as six months.[15] The amount of the drug required to produce a reaction varies greatly from case to case, with doses ranging from 0.016 Gm. (¼ grain) three times a day to 0.097 Gm. (1½ grains) once daily before bedtime.

The diagnosis of a toxic phenobarbital reaction is often difficult to prove, even when strong circumstantial evidence implicates the drug. Administration of the drug after recovery has failed to reproduce the rash in many instances.[5] Patch tests have not been successful[14] and intracutaneous tests recommended by Haubrish[1] and Menninger[5] have likewise failed to be of any real value.[14]

In the present case phenobarbital was given in 0.016 Gm. (¼ grain) and later in 0.032 Gm. (½ grain) doses three times daily for three weeks, or a total dose of 2.2 Gm. (33 grains) before the first signs of drug sensitivity were noticed. The sudden rise in temperature and the severe edema of the face made their first appearance at the time the rash became evident. The stomatitis, pharyngitis and conjunctivitis, reported in only a small percentage of the more severe toxic reactions, appeared about ten hours following the rash, which at this time became hemorrhagic in character and typical of the eruption described by Moss and Long.[14] The leukocyte count was 14,750, with 82 per cent polymorphonuclears. Reports in the literature shows that the white blood cell count may vary from 6,000 to 25,000 and apparently is not proportional to the severity of the toxic reaction.[5] Eosinophilia has been reported.[16] The urine in the present case showed 4 to 5 red blood cells in the initial stages of the reaction and increased to 15 cells on later occasions. This might indicate the presence of small hemorrhages in the kidneys and may have been part of the general hemorrhagic reaction. One one occasion there was a shower of pus cells in the urine, which cleared up spontaneously without medication in twenty-four hours. It is doubtful whether the large doses of penicillin administered in the first few days altered the clinical course appreciably, since there was only a 1.2 degree F. drop in temperature in twenty-four hours and a return to the admission temperature of 103.4 F. in spite of continued administration of penicillin. However, when the patient began to show signs of early pneumonia by the seventh day of his illness, penicillin, in all likelihood, was the one specific agent which tipped the scales in his favor. In spite of the severe systemic upset, the patient's cardiovascular status was altered little, if any, and healing of the infarct progressed favorably, as shown electrocardiographically and by exercise tolerance tests.

SUMMARY

A severe hemorrhagic cutaneous reaction developed following the use of therapeutic doses of phenobarbital as a sedative in the treatment of a recent myocardial infarction.

2. The rash was accompanied by a constitutional upset characterized by fever, restlessness, leukocytosis, stomatitis, pharyngitis, oral hemorrhages and hematuria.

3. An early bronchopneumonia was recognized in the later stage of the illness and effectively treated with massive doses of penicillin.

SULFANILAMIDE SPRAY FOR PAIN IN TUBERCULOUS LARYNGITIS

MERVIN C. MYERSON, M.D.
New York

Tuberculosis of the larynx is one of the more serious complications of pulmonary tuberculosis. This condition is frequently associated with ulceration and pain; these symptoms prevent the patients from swallowing, so that they lose ground not only because of the disease but also because they do not get sufficient food. It has always been thought that tuberculous ulceration in a larynx was the cause of pain. Recent observations on the effect of sulfanilamide powder sprayed on the ulcerated areas, however, have cast doubt on this assumption. It appears that it is not the tuberculous ulcer which causes the pain but secondary infection of the ulcer by pyogenic organisms, for when the involved area is sprayed with sulfanilamide powder the pain immediately disappears.

In addition to the relief of pain, one is impressed with the cleansing effect of the sulfanilamide powder spray. Ulcerations which were previously moist and covered with exudate become dry and present a pinkish or reddish appearance.

It should be borne in mind that a secondarily infected ulcer may not be the only cause of pain in a tuberculous larynx. Principal among the other lesions which cause pain is perichondritis of one or both arytenoid cartilages. When such a lesion is associated with ulceration of the larynx one cannot hope to eliminate the pain entirely, because only that pain which is caused by an infected ulcer is influenced by the sulfanilamide spray.

The sulfanilamide used in each application of the spray weighs between 5 and 10 grains (0.32 to 0.65 Gm.) Not all the powder which is introduced into the larynx is absorbed; most of it mixes with mucus and exudate and is expectorated. Even if all the powder introduced should be absorbed, it would amount to a relatively small dose. Treatment is carried out by the patient or a physician or nurse. The powder is sprayed into the larynx with a powder atomizer. The tongue is held forward by the patient while compression of the rubber bulb or compressed air forces the fine powder into the larynx. The stem of the atomizer has an adjustable tip which can be bent downward so as to direct the powder spray into the larynx.

A few cases have been treated with sulfathiazole powder and penicillin nebulized with oxygen or in an aqueous solution as a spray. The objection to sulfathiazole is that it cakes because it is not soluble, while the objection to penicillin is that it is more expensive, more difficult to prepare, more difficult to keep and readily contaminated.

It should be emphasized that the use of sulfanilamide in cases of secondarily infected tuberculous ulcerations of the larynx can convert a hopeless case into one in which there is a chance. *As a result of the elimination of pain and the restoration of the ability to swallow,* the patients gain weight and strength, some becoming greatly improved.

A fair percentage of patients with tuberculosis of the larynx do not experience pain. Of the large majority which do, however, more than half are caused by ulceration. A series of 1,000 cases that I[1] studied presented an aggregate of 2,059 lesions. Of these, 476 were ulcerations, while the other pain-producing lesions, principally involving the arytenoids, numbered 437. It should be borne in mind that infiltration, tuberculoma and edema may exist in a tuberculous larynx without causing pain. *Only some infiltrative and edematous lesions of the arytenoids, in addition to ulcers anywhere in the larynx, will cause pain. In the arytenoid region the pain is due to active involvement of the perichondrium.*

Sixty patients with tuberculous ulceration of the larynx have been treated with the sulfanilamide powder spray. Those having ulcerations not associated with perichondritis of the arytenoid cartilages were definitely relieved of pain; they were enabled to eat, gained weight and became generally improved. In 14 cases the condition, which appeared hopeless, became favorable as a result of the sulfanilamide powder spray treatment.

The following cases illustrate the dramatic change which such patients may undergo:

J. S., a man aged 42, presented extensive ulceration of the right lateral fold of the larynx and the stump of the epiglottis. He had lost 8 pounds (3.6 Kg.) during the week prior to examination. Sulfanilamide powder was sprayed into the larynx twice daily. At the end of a week he had gained 10 pounds (4.5 Kg.). He was again able to swallow because the secondary infection of the ulceration was under control.

A most striking case was that of a woman aged 28 who had a generalized miliary invasion of her larynx, with extensive ulceration. There was similar involvement of her entire soft palate. The larynx, especially, was extremely painful. When I saw her she was using a spray of 8 per cent cocaine solution. Employment of the sulfanilamide spray immediately eliminated the need for the cocaine. The patient was able to swallow in comfort.

I do not claim that the use of sulfanilamide powder insures a cure. I feel, however, that many patients who succumb to extensive and active tuberculous disease of the lungs and other organs can be spared much of the pain which is so frequently associated with involvement of the larynx. Some lives will be prolonged, some will be saved; but, whatever the outcome, many will not experience the agonizing pain and the inability to swallow which has always accompanied tuberculous ulcer of the larynx.

SENATE HEARINGS ON THE NATIONAL HEALTH PROGRAM

Elsewhere in this issue (page 1021) appears a rather full condensation of the first two days of the hearings on the national health program before the Committee on Education and Labor of the United States Senate which began April 2. Obviously Senators Wagner, Murray and Pepper and Congressman Dingell had organized the first day's session as a sort of conversion and revival meeting, in which the four uplifters would cooperate to bring the doubters promptly to the mourners' bench. Perhaps unfortunately for them, but no doubt fortunately for the people, some agnostics appeared, who tossed doubts and questions that agitated one of the leaders to unholy remonstrances. As might be expected, the newspapers seized on the controversy as the real news of the day; the propaganda of Pepper, the diatribe of Dingell, the weasel words of Wagner and the modulations of Murray failed to find any expression in the public press. By the next day, after Federal Security Administrator Watson Miller expressed his complete approval of compulsory sickness insurance, tendering in the meantime a few encomiums to the medical profession, and after Dr. Mountin of the Public Health Service expressed the official point of view of that branch of the government, the newspapers seem to have lost interest in the proceedings. Readers of The Journal will have to depend on our pages to keep informed as to what goes on.

Attention is called in the digest of the hearings in this issue of The Journal to the forthrightness with which Senator Taft condemned the entire proceedings as a venture in socialism, to the manner in which Senator Smith of New Jersey opposed the slander, innuendo and invective with which Congressman Dingell attacked the medical profession, to the statement of Senator Wayne Morse of Oregon that he felt Oregon and Washington were making a reasonable trial of a voluntary system and that he wanted representatives of those states to appear at the hearings and to the statement of Senator Ellender of Louisiana that he opposes compulsory medicine except as a last resort.

In closing his presentation Senator Pepper offered amendments to the Wagner-Murray-Dingell bill with a view to incorporating in that measure the features of the Pepper maternal and child health bill. He states that he will not push the latter until he finds out what happens to the former.

Dr. Mountin indicated that it would be desirable to place the health functions of the Children's Bureau under the U. S. Public Health Service, whereupon Mr. Watson Miller stated that negotiations have been under way to bring about functional unity in these agencies without apparently taking from the Children's Bureau either autonomy or its appropriation.

Amazingly Senator Murray several times referred to Mr. Watson Miller, the lay administrator who is responsible for health functions in the government, as "Dr. Watson," and apparently Senator Aiken was under the same misapprehension and also referred to him several times as "Dr. Watson." Presumably even the senators feel that health functions are properly problems for medically trained administrators.

Finally Dr. Mountin expressed his belief that medical research and medical education as well are properly functions of the federal government and his own philosophy, which he states is the philosophy of this bill, that "the government ought to lift the costs of illness off of the backs of the sick people and place it on the broad shoulders of society." That after all is the fundamental issue. Is there to be individual responsibility and individual freedom in the American democracy or is the federal government to assume responsibility for all of us and are we to sacrifice our freedom for the kind of service that the federal government can render?

THE NEW ZEALAND EXPERIMENT

New Zealand has been experimenting with a government controlled system of medical care. The New Zealand Social Security Act of 1938 inaugurated a wide range of health and medical benefits which commenced on April 1, 1940 and gradually increased. Under the capitation system a doctor is paid a social security fee for every "head" on his list of patients for the year. A "salaried service system" is a special arrangement of limited extent designed for remote country districts, in which the doctor receives a fixed annual salary. Under the "fee-for-service system" the patient signs a declaration saying he has been treated by a doctor who countersigns the form and makes the claim on the Government Health Department for full settlement of his fee. A "refund system," which is the only one of these methods officially approved by the British Medical Association, provides for full payment of the fee by the patient directly to the doctor and for the recovery by the patient from the Government Post Office of the portion of the fee paid through the social security system. A "token system" enables the patient to pay the difference between the social security allowance and the doctor's fee, the doctor sending in the claim for the remainder.

In a recent survey addressed to 1,500 New Zealand doctors, of whom almost 200 were overseas, about 1,000 replies were received. A majority of the physicians expressed their preference for the refund system, although a considerable number indicated preference for each of the other technics.

The Journal has recently received from a government official in New Zealand, who must be kept anonymous, some information concerning the actual working of the system which it is believed should be made available to American readers. The letter indicates that the islands are having trouble in getting medical personnel; salaries offered approximate 800 pounds a year plus deferred pay of 200 pounds a year, but young doctors "make money too easily today in New Zealand and any recent graduate can put up his plate and start earning immediately at the rate of 2,000 to 3,000 pounds per year." Here is the statement of what has occurred in New Zealand:

> General practitioner services are provided in a number of ways:
>
> (1) About twenty salaried positions have been created in remote and unattractive areas. This is a logical and satisfactory way of dealing with these particular places.
>
> (2). An attempt was made to work a capitation scheme. This was resisted by the profession, and consequently
>
> (3) A fee for service scheme was introduced. The capitation system still survives, but barely so, and is not practiced exclusively by any doctor.
>
> The fee for service scheme again is operated in three ways:
>
> 1. The doctor sees the patient and claims direct from the state, accepting the state fee in full and complete settlement of his charge. The state pays 7/6 per visit or consultation, which sum is increased to 12/6 for night calls or Sunday calls.
>
> 2. The doctor gives the service and sends in his bill in the ordinary way to his patient. When the patient pays, the doctor gives him a statement setting out the number of attendances, which enables the patient in turn to collect from the state on the basis of 7/6 per attendance. Doctors working this scheme as a general rule continue to charge 10/6 or 12/6 per visit or consultation.
>
> 3. The doctor by happy compromise gets the best of both systems by claiming direct on the state for 7/6 and collecting 3/– cash from the patient which he can put into his pocket and possibly conceal from the tax authorities.
>
> The system, of course, is shocking, and it is not surprising that the standards of medical practice have deteriorated. Doctors are not limited as to numbers of patients and some are making round about £10,000 per annum, which means they see 80 to 90 patients daily for six days a week for eleven months in the year. There are all the evils of hurried medicine, overvisiting and overprescribing. Altogether New Zealand affords a wonderful example to the rest of the world of how not to do it.

One might hope that our American statesmen who are trying to rush the people of the United States into government controlled medicine could heed the warnings that come from parts of the world where free people have been regimented into the kind of schemes that they propose for us. Unfortunately Senators Murray and Wagner seem to be little concerned with the nature of the medical service that will be rendered, with the progress of medical science or with the type of person who will choose medicine as a profession in the future. They crave only the endorsement of those who would destroy the American democracy and lead us into socialism or communism. They seem to look on medical care as the stalking horse that herds the unthinking into the corral where freedom disappears.

ANTITOXIC ACTION OF PENICILLIN

Supplementing their earlier work with meningococcus endotoxin[1] Miller and his associates[2] of the University of Chicago Department of Medicine report that penicillin has an equally effective neutralizing action against gonococcus endotoxin. The endotoxin used in their tests was prepared from five strains of gonococcus grown for eighteen hours on an agar medium containing casein digest and cystine. The organisms were repeatedly washed in saline solution, suspended in distilled water and then allowed to autolyze for six hours at room temperature, followed by fourteen hours' storage at 4 C. The autolysate was then neutralized, heat sterilized (60 C. for thirty minutes) and its concentration adjusted to about 1 per cent solids. White mice weighing 18 to 20 Gm. were injected intraperitoneally with graded doses (0.1 to 0.5 cc.) of this 1 per cent endotoxin. Half of each group served as untreated controls. The other half were each given eight subcutaneous injections of 150 units of penicillin. The injections were usually given ninety and forty-five minutes before and one, three, five, nine, twenty and twenty-four hours after injection of the endotoxin. In a typical experiment 22 control mice were each injected with 0.1 cc. of endotoxin. Of these, 15 died, a mortality rate of 68 per cent. Of 22 mice treated with penicillin similarly injected, only 2 died, a mortality of but 9 per cent.

---

[1] Boor, A. K., and Miller, C. P.: Science **102**: 427 (Oct. 26) 1945.

[2] Miller, C. P., and Boor, A. K.: Proc. Soc. Exper. Biol. & Med. **61**: 18 (Jan.) 1946.

Less spectacular therapeutic effects were demonstrated with multiple doses of the endotoxin. Thus of 22 control mice injected with from 0.4 to 0.5 cc. of endotoxin 21 died. Of 22 penicillin treated mice given the same doses only 12 died. The combined results of all their groups, totaling 176 control and 210 penicillin treated mice, showed an average mortality rate of 76.7 per cent for the control mice as contrasted with but 36.5 per cent for mice receiving penicillin treatment. Other substances, such as saline solution and tryptic digest of casein, repeatedly injected in place of penicillin failed to influence the lethal action of the endotoxin.

A satisfactory theory has not yet been developed to account for the antiendotoxin action of penicillin. The action presumably is more complex than a simple conjugation of toxin and antitoxin.

IMPROVING CHILD CARE

A recent bulletin from the Metropolitan Life Insurance Company characterizes the past thirty-five years as "the golden age of child health." The statistics cited are a startling contrast to the sad pictures painted by the propagandists who want to communize the care of children in the United States. They talk about hundreds of thousands of unnecessary deaths. The statisticians say that the decrease in mortality at the ages of 1 to 14 among white children was close to 80 per cent in the period between 1910 and 1945. The bureaucrats who want to concentrate the care of children in the Children's Bureau speak only of inadequacies in the prevention of infectious diseases. The statisticians say that the death rate from measles, scarlet fever, whooping cough and diphtheria declined over 90 per cent in the period reviewed.

The chief factor in the control of disease is not administration or money; it is the research that reveals the cause, the method of dissemination, the method of prevention and an effective method of treatment. Mortality from diphtheria decreased 97 per cent in the last thirty-five years because we found the answers to these questions for diphtheria. The death rates from diarrhea and inflammation of the bowels among children declined 95 per cent because we developed pasteurization of milk, pure water and food supplies and modern refrigeration and educated the mothers in how to protect the child against the hazards of these infections. For every child that now dies from this cause there were twenty such deaths thirty-five years ago. True, some children still die from infections of the bowel during infancy. Unfortunately some of these children occasionally die even in the finest hospitals and institutions, because human beings occasionally become careless in caring for children. The hazard is greater when a careless person is caring for 20 babies than when an intelligent mother is caring for her own baby.

The value of scientific statistics is the manner in which they point the way to areas of need in diminishing sickness and death rates. The death rates from pneumonia and influenza declined only to one sixth of the rate prevailing previously because we did not have until recently specific methods of prevention and treatment. A much greater decline may be anticipated in the next generation. The death rates from accidents declined only about one half. Accidents have first place as a cause of death among children at ages of 1 to 14. Automobile accidents are the only important cause that shows a higher death rate now than prevailed thirty-five years ago. Yet even the death rates from automobile accidents among children have been decreasing steadily since 1930. The prevention of unnecessary deaths from accidents demands a continuous campaign of education against carelessness and thoughtlessness. Perhaps it demands also a rise in the general intelligence level of mankind.

Current Comment

THE ARMY MEDICAL LIBRARY

Since 1836, when the Army Medical Library was first established, it has grown and developed, both in the contents and in its functions. Today it includes more than a million items, of which more than 500,000 are bound volumes. Its special collection includes a medical art collection with some 10,000 items and references to more than 50,000 portraits and illustrations. It houses 513 medical incunabula, and of some early published medical works it has the only copy known. Its contributions to medical bibliography, especially the Index Catalogue, have been among the most significant of the factors associated with the tremendous advance of medical science not only in the United States but throughout the world. In 1941 Congress passed a bill authorizing a new library and museum to be located on Capitol Hill. After extensive consultations with the librarian, drawings were made by the architects and a site has been selected for a new Army Medical Library Building on Capitol Hill adjoining the Library of Congress. This structure has a definite place among the projects outlined by the Fine Arts Commission of the District of Columbia as a part of the postwar program. At present the library is directed by Col. Leon L. Gardner, and Mr. Wyllis E. Wright is the librarian. No doubt Congress will soon be asked to make the necessary appropriation for completing the construction of the new library and for the transfer of its contents to the new building. A recent service by the Army Medical Library is the official publication of the current list of medical literature, which presents each week a general view of the contents of the periodicals received in the library. This has been an invaluable service to those in the field of medical research. Physicians who are interested in continuing the advance of medical science in this country will do well to support in every way possible the speeding of the completion of the library so that its services may be more and more available, not only to the research worker, but to the practicing physician.

DIISOPROPYL FLUOROPHOSPHATE (DFP)

Among the interesting subjects discussed at the recent session of the Federation of American Societies for Experimental Biology at Atlantic City was diisopropyl fluorophosphate (DFP). Investigators from the Chemical Warfare Service at the Edgewood Arsenal and from various collaborating institutions participated in a symposium devoted to the current status of this interesting compound. Diisopropyl fluorophosphate appears to produce an irreversible inhibition of the enzyme cholinesterase, in contrast to the reversible inhibition produced by physostigmine and neostigmine. This property makes it interesting to the neurophysiologist as a tool for determining the role acetylcholine and its hydrolyzing enzyme may play in conduction of the nerve impulse. Two groups of workers have employed it for this purpose, obtaining apparently discrepant results. Consequently final decision as to this fundamental question cannot be made at the moment. In addition to its role as a tool in research, its potential usefulness as a therapeutic agent was also discussed, particularly with reference to myasthenia gravis and glaucoma. Injected intramuscularly into patients with myasthenia gravis, it relieved the weakness of such patients for longer periods than neostigmine, but not to as high a degree. Instilled locally in human eyes, it produces a prolonged miosis with a decrease in intraocular tension for from four to eight days. Used for patients with glaucoma it was frequently effective when both physostigmine and pilocarpine failed. These preliminary results do not permit a conclusion as to its ultimate role in the medical treatment of either of these conditions but give great promise that a valuable therapeutic agent may be the by-product of research undertaken for strictly military purposes.

ASSOCIATED MEDICAL CARE PLANS

Under the Organization Section in this issue (p. 1036) of The Journal appear the details of the incorporation of Associated Medical Care Plans. Thus the official step has been taken to make effective the resolution adopted by the House of Delegates at the last annual session of the American Medical Association leading to the coordination of existing plans into a national plan and at the same time permitting to the individual state plans autonomy in their operations. Arrangements have already been made for sessions of the board of directors of the corporation so that it may begin actual functioning in the near future. Physicians who are interested in the extension of the voluntary medical care plans should familiarize themselves with the nature of this organization and its method of functioning.

SEWAGE POLLUTION AND POLIOMYELITIS

Although there is some difference of opinion on the relation between the sewage pollution of streams and the spread of infantile paralysis, the desirability of eliminating stream pollution is unquestionable. The Izaak Walton League of America has issued a pamphlet[1] written by Dr. Edward A. Piszczek, director of the Cook County Department of Public Health, on the apparent relation between pollution of the Desplaines River in northern Illinois and the development of poliomyelitis. The Izaak Walton League thus joins with the National Foundation for Infantile Paralysis in aiming to bring about a speedy abatement of sewage pollution of streams. Specifically the league endorses the Clean Streams Bill introduced into the House of Representatives and the Senate. Without evaluating the technical details of these measures, the medical profession can endorse the principle of maintaining the purity of the streams of this country.

BLOOD CIRCULATION OF PROMINENT ATHLETES

Arne Andersson and Gunder Hägg, both holders of world's records in long distance running, were subjected to detailed examination of the circulation. Gunder Hägg is a 24 year old Swede who has broken seven world's records for various distances from 1,500 meters to 5,000 meters. Arne Andersson was a rival and practically equally great runner, who disputed with Hägg principally in the summer of 1944. The examination of Hägg was made on Oct. 2, 1942 and of Andersson on Feb. 5, 1944. Nylin's[1] report of the investigations indicated that both could be considered healthy and without any defect whatever from the clinical point of view. Both exhibited a high stroke volume and a somewhat greater heart volume at rest, which resulted in a normal index of heart volume over stroke volume of 10.8 for Hägg and 10.2 for Andersson. Hägg's examination revealed an elastic heart which reacted with decrease in volume in Valsalva's experiments, an extreme respiratory arrhythmia after heavy work and remarkably normal oxygen after heavy work. In Andersson's case the blood pressure rose to remarkably high levels with heavy work and the heart rate to a maximum of 198 beats per minute. Nylin reported that the results of these examinations did not definitely explain the remarkable performance of the athletes under study though there is ample evidence of good training. His tentative conclusion is that these athletes differ from ordinary healthy persons by reason of an extremely well developed technic and judgment. This theory cannot be accepted until other and more extensive comparative studies on athletes have been made, but it will be extremely interesting to determine whether exceptional athletic ability like that of Hägg and of Andersson is the result of innate physical attributes or primarily of special training measures.

MEDICINE AND THE WAR

NAVY

NAVAL MEDICAL OFFICERS COMMENDED

Secretary of the Navy James Forrestal recently commended a number of key personnel in the Bureau of Medicine and Surgery for meritorious performance of duty during the war period.

Medical officers who have been commended include:

Capt. Robert A. Bell (MC), U.S.N. (Spearville, Kan.) for formulation of policies concerning physical standards with relation to efficient mobilization and maximum utilization of naval personnel.

Comdr. S. A. Britten (MC), U.S.N.R. (Syracuse, N. Y.), officer in charge of the Tuberculosis Control Section and organizer of an effective tuberculosis control program in the Navy.

Capt. James B. Butler (MC), U.S.N. (Washington, D. C.), who was commended for his supervision of the design of medical facilities ashore and afloat as head of the Design and Construction Branch, Planning Division.

Comdr. J. W. Ferree (MC), U.S.N.R. (New York) for outstanding performance of duty while serving as officer in charge of venereal disease control.

Comdr. H. P. Hopkins (MC), U.S.N.R. (Chatham, Mass.), officer in charge of the Section of Tropical Disease Control, who was responsible for development and testing of new equipment and methods for insect control.

Capt. Frederick R. Lang (MC), U.S.N.R. (New York), officer in charge of the Division of Medical Statistics. His commendation was given for outstanding performance of duty as assistant naval attache, assistant attache for air and staff medical officer at the United States embassies at Kuibyshev and Moscow from April 3, 1942 to July 27, 1944. "During bombing attacks," the commendation reads, "he courageously and efficiently treated the wounded under fire and, determined to further research and advance the effectiveness of his profession, persisted in his medical efforts until he contracted typhus."

Capt. Howard H. Montgomery (MC), U.S.N., (Washington, D. C.,) who was cited for outstanding performance of duty, first, as head of the Division of Physical Requirements and Medical Records and, later, as organizer of the Navy's medical rehabilitation program.

Lieut. Comdr. Mary D. Pettit (MC), (W), U.S.N.R. (Albany, N. Y.), who served as special assistant to the Surgeon General on problems affecting the Women's Reserve.

Comdr. Henry A. Schroeder (MC), U.S.N.R. (Bethesda, Md.), who, as a medical liaison officer between the Bureau of Aeronautics and the Bureau of Medicine and Surgery was instrumental in the development and production of antiblackout suits for naval aviators.

NEW YORK UNIVERSITY COLLEGE OF MEDICINE CITED

A Certificate of Commendation for service in the war effort was recently awarded to the New York University College of Medicine by the Navy Department. The citation accompanying the award, which was presented to Acting Dean Sheehan by Vice Admiral Ross T. McIntire, Surgeon General of the Navy, said "The Bureau of Medicine and Surgery wishes to take this opportunity to congratulate you and the members of your faculty for your outstanding contribution to the war effort and to medical education. . . . The Medical Department of the Navy greatly appreciates your continuous cooperation and assistance in all matters of vital importance to this bureau. I feel that medical schools have given a most distinguished service which has had considerable effect on the war effort. . . ." "I am proud," he continued, "to present to you a Certificate of Commendation. I want you to know that the personnel of the Medical Department of the Navy joins me in expressing sincere appreciation of your splendid cooperation and assistance in handling our medical personnel war problems."

NAVY AWARDS AND COMMENDATIONS

Captain William Drew Small

The Legion of Merit was recently awarded to Capt. William D. Small, formerly of Scarsdale, N. Y., "for meritorious conduct in the performance of outstanding service in the Logistics Division, on the staff of the commander in chief, United States Pacific Fleet and Pacific Ocean areas, from Dec. 19, 1943 to Sept. 1, 1945. As assistant to the chief of the medical section until Jan. 19, 1945, and subsequently as deputy fleet medical officer and chief of the medical section, Captain Small displayed outstanding administrative ability, initiative and diligence in the formulation of policies concerning care and treatment of the sick and injured and the health of personnel, and in the planning and execution of a program for medical supply, evacuation and hospitalization of casualties, and epidemic disease control in the Pacific. His professional excellence and devotion to duty were material contributing factors in the successful prosecution of the war against the Japanese Empire and were at all times in keeping with the highest traditions of the United States Naval Service." Dr. Small graduated from Bowdoin Medical School, Brunswick, Maine, in 1918 and entered the service April 8, 1919.

Captain Francis J. Braceland

The Legion of Merit was recently presented to Capt. Francis J. Braceland for "wartime services to the Bureau of Medicine and Surgery." The citation accompanying the award specified "exceptionally meritorious conduct in the performance of outstanding services to the government of the United States as special assistant in psychiatry to the Surgeon General of the Navy and later as chief of the division of neuropsychiatry, Bureau of Medicine and Surgery, from January 1942 to October 1945. Possessing an international reputation in the field of psychiatry, Captain Braceland was responsible for the procurement and training of medical officers and enlisted personnel to adequately establish psychiatric services to all naval hospitals in the United States and the advanced bases. His medical knowledge and ability contributed immeasurably to the welfare of the Naval Medical Corps during these critical years." Dr. Braceland graduated from Jefferson Medical College of Philadelphia in 1930 and entered the service in June 1942.

Lieutenant Commander Russell M. Jensen

Lieut. Comdr. Russell M. Jensen in the U. S. Naval Reserve on inactive duty was recently awarded the Navy Unit Commendation for services rendered on Dec. 7, 1941 at Pearl Harbor. The commendation reads "By virtue of your services in the unit during the above period (Dec. 7, 1941) you are hereby authorized to wear the Navy Unit Commendation Ribbon, which is transferred herewith. This authorization has been made a part of your official record in the Bureau of Naval Personnel. The commendation is used by direction of Chief of Naval Personnel W. C. Palmer Jr., Lieutenant Commander, U.S.N.R." Dr. Jensen was on duty in the naval hospital at Pearl Harbor at the time of the attack by the Japanese and remained in Hawaii and the Midway Islands until October 1943, when he was transferred to the United States for duty at the Naval Hospital, Oceanside, Calif. He graduated from Northwestern University Medical School, Chicago, in 1936 and entered the service Feb. 4, 1941

SWEDISH NAVAL MEDICAL CORPS OFFICER VISITS UNITED STATES

Commodore Herbert Westermark, medical inspector of the Swedish naval medical corps, recently spent a month in the United States studying and inspecting naval medical facilities.

ORGANIZATION SECTION

THE WAGNER-MURRAY-DINGELL BILL

Hearings on S. 1606—To Provide for a National Health Program

(Note.—*This is a condensation of the verbatim report of the hearings.*—Ed.)

United States Senate, Committee on Education and Labor.
April 2, 1946.

The Honorable James E. Murray, (Chairman) Presiding

Present: Senators Murray, Thomas, Pepper, Wagner, Taft and Smith.

Also Present: The Honorable John F. Dingell, a Representative in Congress from the state of Michigan.

Senator Murray: I wish to insert in the record of the hearings the President's Health Message, the National Health Bill, S. 1606, copies of correspondence between President Truman and myself relative to certain amendments proposed by Mr. William Green, president of the American Federation of Labor, and fourthly, reports on the National Health Bill from a number of federal agencies including the Bureau of the Budget, the Federal Security Administrator and the Secretary of Commerce. Seven years ago, in April 1939, this committee had referred to it the first comprehensive bill for a national health program, S. 1620, introduced on Feb. 28, 1939 by the distinguished Senator from New York, Mr. Robert F. Wagner. Through a subcommittee, of which I had the honor to be chairman, we held extensive hearings, heard many witnesses and received many statements on health conditions, needs and proposals. Early in August 1939 I made a preliminary report for the committee in which I summarized the results of the hearings on S. 1620. It was already late in the Congressional session and there were some unresolved problems concerning the bill. Consequently the committee could only record its intention to report out an amended bill at the next session of the Congress.

We were convinced at the end of 1939 that there were large unmet health needs in this country, that the federal government had an obligation to help meet those needs, and that this could and would be done.

Our intention to proceed with national health legislation early in 1940 was, however, frustrated by a catastrophic event. The war in Europe was gathering momentum and its threats to our national security were becoming clearer and clearer. As the clouds of war rolled over us and finally engulfed us, comprehensive national health legislation had to be laid aside, to await the end of the war.

We did consider a limited program in 1940. The National Hospital Act of that year, S. 3230, introduced by Senators Wagner and George, providing federal grants for the construction of some needed hospitals and making limited grants toward their maintenance, was considered. After hearings on the bill, I reported it favorably from this committee and it was passed by the Senate. Unfortunately, it failed to receive active attention in the House of Representatives.

Between 1941 and 1945 we have had many health measures before us dealing with special problems. Other bills containing health programs to be developed as parts of social security and related programs were also pending before other committees of the Senate.

During the war years our Special Subcommittee on Wartime Health and Education did a magnificent job, studying and reporting on special problems and needs precipitated by the war. The nation owes a real debt of gratitude to Senator Pepper, chairman of that subcommittee, and to the other members, Senators Thomas, Tunnell, LaFollette and Wherry, for the comprehensive, thorough and penetrating work they have done. More recently Senator Pepper and other members of the Committee on Education and Labor have also carried forward the work on health problems through our legislative subcommittee on public health.

The hearings held by the subcommittees and the reports prepared by Senator Pepper and his able committee will long continue to be invaluable sources of information and helpful guides for constructive health plans. The public health laws of the United States were completely recodified in 1944, making somewhat more ample provisions for various public health programs.

Last year this committee had before it a bill proposing the first step toward a comprehensive national health program, including federal grants to survey hospitals and public health centers, to plan the construction of additional facilities and to assist in such construction. That bill, S. 191, introduced on Jan. 10, 1945 by Senators Hill and Burton, was considered in public hearings extensively and extensively revised and reported favorably by this committee on Oct. 30, 1945 and passed by the Senate Dec. 11, 1945. It is now being considered by the Committee on Interstate and Foreign Commerce in the House.

Thus it is clear that extensive studies and deliberations have been devoted to national health legislation over a period of seven years. Many important bills have been considered and some have been or are in the process of being enacted. Thus while this is true it is also true that most of the main health problems, the basic problems that clamored for attention and action in 1939, are still unsolved. The principal unmet health needs of the last years before the war are still unmet and the war has made some of them more serious and more acute.

The bill which is now before us transcends all of the earlier bills in importance. It represents a logical culmination of the vast amount of work already done in planning for the nation's health. It offers a constructive program for assuring to all of the population the medical care that we all look forward to having in the future.

On November 19 President Truman submitted to the Congress his recommendation for a comprehensive and modern health program for the nation, consisting of five major parts, each of which contributes to all of the others.

The five parts are (1) federal grants for construction of hospitals and related facilities, (2) expansion of public health, maternity and child health services, (3) federal grants for medical education and research, (4) establishment of a national social insurance system for the prepayment of medical costs and (5) expansion of our present social insurance systems to furnish protection against loss of wages from sickness and disability.

On the same day the National Health Bill, S. 1606, was introduced in the Senate by Senator Wagner and myself and in the House of Representatives by Representative John F. Dingell of Michigan. This bill provides for three of the five points of the President's program, namely expansion of public health, maternity and child health services, more adequate funds for medical education and research and a system of prepaid medical costs. Federal aid for the construction of hospitals and related facilities, the first of the President's five points, had already been provided for in the Hospital Survey and Construction Act which passed the Senate in December 1945 and is now before the House. Insurance benefits to compensate for loss of wages during periods of sickness and disability, the President's fifth point, is provided for in the general Social Security Bill now pending before the Finance Committee of the Senate and the Ways and Means Committee of the House.

Thus far hearings have been scheduled only for the month of April. The witnesses who will appear during the course of these hearings are representatives of national organizations, both for and against the bill, and spokesmen of the federal agencies most directly concerned with the health program.

Arrangements have already been made with the Legislative Reference Service of the Library of Congress to have a research analyst prepare a weekly summary of all testimony and written statements. These summaries will be available to the public and will also facilitate committee consideration of the views and recommendations presented to us.

During recent years there has been extensive, and sometimes intensive, controversy over the question of whether we should have compulsory health insurance. These hearings will provide a new occasion—perhaps the best opportunity yet afforded—for all the issues in this controversy to be thoroughly examined. These hearings offer a challenge to all who participate, a challenge that can be successfully met only by a sincere determination on the part of every one to try to understand the other man's point of view and to examine the problems in the light of facts rather than through slogans or prejudices.

I would like at this time to call attention to an editorial which appeared in the *Post* this morning, which discusses this situation in the country, where people sometimes instead of discussing these problems intelligently and dealing with facts go outside the facts and attempt to charge that some of these progressive measures that are being advocated in the Senate are Communistic or Socialistic. I would recommend that everyone read that editorial in the *Post* this morning.

I am confident that—

SENATOR TAFT: I think it is very Socialistic, so I disagree entirely with the editorial. I think that you might have that to start with; if you are going to make a partisan statement, I am going to make one.

SENATOR MURRAY: I did not make a partisan statement.

SENATOR TAFT: But if you are going to give a rebuke to people who consider it Socialistic, I consider it Socialism. It is to my mind the most Socialistic measure that this Congress has ever had before it, seriously.

SENATOR MURRAY: I do not understand where you get the notion that I was giving any rebuke, I merely was calling—

SENATOR TAFT: You were commending the *Post* for rebuking those who called it Socialistic and a Socialistic measure.

SENATOR MURRAY: I was merely calling upon the people to consider these matters without going outside the facts and resorting to abuse like you sometimes do when we have measures like the Full Employment Bill on the floor. You charged that to have been taken out of the Constitution of the Soviet Republic.

SENATOR TAFT: It was, and Congress fortunately took out all of that part and passed a very good bill by means of the efforts of the minority of this committee, and not your efforts.

SENATOR MURRAY: I want to tell you that they passed a good bill because we stood by our guns and you voted for it too and then afterward tried to charge it with being a Communistic movement, which was absolutely false and you have not been given any great credit in the country for your actions in that matter.

SENATOR TAFT: On the floor of the Senate we adopted every principal amendment that the minority of this committee tried to put in, which you refused to accept and which the Senate adopted. And after the Senate adopted all of our amendments I voted for the bill because it then was a sound bill.

SENATOR MURRAY: I want to say that nothing of the kind occurred. You changed the name of the bill from "Full Employment" to "Maximum Employment," and I cannot understand the difference in meaning from "Maximum Employment" to "Full Employment."

SENATOR TAFT: That is a minor feature.

SENATOR MURRAY. You were attempting to confuse the minds of the people on a bill that was very worthy and very valuable to this country.

SENATOR TAFT: We obtained everything that we wanted.

SENATOR MURRAY: I do not propose to let you bluff me on anything. Now, you think that you are going to get away with it, but you are not going to get away with it with me. You are not going to make a grand-stand play.

SENATOR TAFT: Not at all. You started it. I never would have said a single word about it.

SENATOR MURRAY: You had so much gall and so much nerve that you would not let me complete my statement. I would have been glad to give you an opportunity to express yourself as far as you wished, but you are very impolite, you are very sarcastic, and I do not think that you are making any success with it.

SENATOR TAFT: Mr. Chairman, I think that you are the one that is being impolite.

SENATOR MURRAY: I am the chairman of this committee, and I want you now to subside and let me go ahead with this hearing.

SENATOR TAFT: You are so polite, Mr. Chairman, that I accede to your ruling.

SENATOR MURRAY: I want you to shut down right now or I will call the officers here and have you removed from the room, if you are going to make a rough-house out of it.

SENATOR TAFT: Mr. Chairman, I want—

SENATOR MURRAY: You think that you are pretty smart, a good bluffer and a bulldozer, but you cannot get away with it.

SENATOR TAFT: I think if that is the spirit in which you are going to conduct these hearings—

SENATOR MURRAY: You are expressing the spirit.

SENATOR TAFT: You started it. You started your statement with an attack upon the opponents of the bill, and I have a perfect right to reply to it, and I have done so courteously.

SENATOR MURRAY: You have no right to interrupt me in my statement here. You have no right to interrupt me. You are very impertinent and very unfair, and I do not think that you are creating any good impression on the people here that are listening to these proceedings.

SENATOR TAFT: Well, Mr. Chairman, you showed your intention to conduct this solely as a propaganda machine. This hearing is just a propaganda machine, and that is all right with me. That is your right, you are the chairman of the Committee, and I am perfectly agreeable to it.

SENATOR MURRAY: That is one of the things that the editorial is reprimanding here this morning. Everything that has been attempted to be done for the welfare of the American people has men like you coming along charging it with being Communistic. Nothing, as this editorial says, has done so much to raise the Communists' prestige in this country as the habit fallen into by a few of attributing to the Communists everything that is progressive. Communists do not deserve such kudos; "progressivism" is thoroughly American and thoroughly a democratic characteristic. But you want to make out that every effort on the part of the people of this country to make some improvement is Communistic.

SENATOR TAFT: Mr. Chairman, I did not call it Communistic, I called it Socialistic.

SENATOR MURRAY: You charged the Full Employment Bill—

SENATOR TAFT: That it came right out of the Soviet constitution, that is all that I said. I read it on the floor.

SENATOR MURRAY: Which was absolutely false and you know it.

SENATOR TAFT: Not at all.

SENATOR MURRAY: And you are going to make a political play—

SENATOR TAFT: The words came right out of the Soviet constitution. However, that is a minor question.

SENATOR MURRAY: I just want to say that you are reflecting your general habit and conduct here this morning that you do every time a progressive measure is up for consideration in the United States Senate.

SENATOR TAFT: Mr. Chairman, your politeness is so great that I think that I should state that I intend to present to this committee a comprehensive plan for health and federal activity in the health field which I consider is not Socialistic.

SENATOR MURRAY: Wait until I get through with my statement, and then you can present anything that you please.

SENATOR TAFT: I did not want to interrupt you, but it seemed to be a conversation, so I will wait until you get through.

SENATOR MURRAY: I am confident that when these hearings are concluded there will be less conflict and more agreement on what the federal government should do, so that the full benefits of modern medicine can be brought within the reach of all of our people. Among the unsung heroes and heroines of World War II are the members of the medical profession. On the battle front are doctors, dentists, nurses, corpsmen who wrought miracles of medical care. On the home front, those who remained to serve the civilian population performed patiently and perseveringly under a work load of unprecedented proportions. Now that the war is over, another task of heroic proportions confronts the medical professions, to bring the full gamut of preventive, diagnostic and therapeutic health services within reach of the fifteen or more million men and women who served in the armed forces, the civilians who backed them up on the homefront, and the families of both. It is my hope that the work of this committee will result in a national health program that will open for the public a new chapter in man's age old quest for health and vigor and will give the professions and the hospitals a new and larger opportunity to serve the public in their beneficient work. We have here this morning with us two other authors of the bill, the chief author being Honorable Robert Wagner, United States Senator from New York, and I wish to call on Senator Wagner at this point.

Senator Taft: I would like to make a statement, and I have to leave for the mark-up on the Housing Program Bill.

Senator Murray: No, you will not make a statement now.

Senator Taft: I stand on my right to make a statement in this committee, and now either that or I will take the whole matter on the floor and describe the spirit in which you have conducted this hearing, in which you are proposing to conduct this hearing, and all I wish to make is this statement.

Senator Murray: You can have an opportunity to make your statement at the proper time. This meeting was scheduled and the next witness is Robert Wagner, and he will make his statement and Mr. Dingell of the House will make his statement, and then you can make your statement, and I am going to regulate this hearing in that form.

Senator Taft: I am a member of the committee, and I demand the right to make a statement. I have to attend the hearings on the mark-up on the Wyatt Housing Bill, which is being considered in the Banking and Currency Committee, and all I wish to say, and it is very simple, is that—

Senator Murray: This hearing will be going on for a month or six weeks, and you will have plenty of time to make your statement.

Senator Taft: You have used this as a method of propaganda, of your statement, and I propose to make a statement.

Senator Murray: That is a falsehood, that is slander, and that is in line with your general conduct. I resent it.

Senator Taft: You can resent it all you like, and I don't resent anything that you say.

Senator Murray: I resent your further interruptions, and I will not consent to them.

Senator Taft: Mr. Chairman, I propose—

Senator Murray: I will have to demand that you—

Senator Taft: I intend—

Senator Murray: I will have to demand that you subside. I am not going to permit you to run this committee.

Senator Taft: Mr. Chairman, I want—

Senator Murray: As long as I am chairman of this comminttee, you are not going to come in here and start this kind of thing.

Senator Taft (to the reporter): I hope that you get all of this, because I want to take it to the floor.

Senator Murray: You can take it anywhere you want.

Senator Taft: All I intend to do is to—

Senator Murray: You can take it to the National Republican Committee or any place you want to.

Senator Taft: I intend to present to this committee a bill providing—

Senator Murray: Now, you can make that statement at the proper time. You are not going to make that statement now.

Senator Taft: Mr. Chairman, I have a right to make a statement to this committee, and I have never heard of a chairman of a committee refusing to recognize a member when he asked to make a statement.

Senator Murray: You are hearing one now.

Senator Taft: I am hearing one now.

Senator Murray: Because you have been impertinent and insulting.

Senator Taft: I have neither been impertinent nor anything as compared to the chairman.

Senator Murray: You interrupted me in my statement without my consent, and you did not ask me the privilege, you just interrupted.

Senator Taft: Mr. Chairman, I now desire to state a very simple statement that I intend to offer to the Senate and to this committee, a comprehensive bill providing for federal aid—

Senator Murray: You will make that statement at some other time, but not at this time, and you are not going to get away with this bulldozing that you are attempting here, to come in and disrupt this meeting, and you are not going to get any credit for it either with the American people.

Senator Taft: For federal aid to states as to the operation by states of comprehensive—

Senator Murray: You are not going to come in here like this.

Senator Taft: Of comprehensive state medical aid—

Senator Murray: You are interrupting the chairman of this committee, and you can shut your mouth and get out of here if you do not like the way it is being conducted.

Senator Taft: To be conducted by the states—

Senator Murray: You are not going to get away with it, and I am not going to let you do it.

Senator Taft: I move that when you have recovered—

Senator Murray: You may stop taking this.

(Discussion off the record.)

Senator Murray: You have disrupted the committee meeting, and you have attempted to make something other than a dignified meeting by your conduct. You are so self opinionated, and you think that you are so important that you think that you can come into this meeting and disrupt it.

Senator Taft: Mr. Chairman, I have not the slightest attempt to disrupt anything. I asked to make a statement.

Senator Murray: You did not ask to make a statement.

Senator Taft: I just did.

Senator Murray: You just did. You asked to make a statement and then you made it anyway.

Senator Smith: I feel that the Senator should be allowed to make his statement. I think that that is only fair.

Senator Murray: I am not going to disrupt the procedure that I have adopted. There are two or three opening statements that are to go into this record.

Senator Smith: I think that he should make his statement.

Senator Murray: I told him several times that he would be given an opportunity to make a statement. If he wants to come in here and act like a Senator and a statesman, he will have an opportunity to make his statement at the proper time.

Senator Taft: That is exactly what I have done, and I make the request now to make the statement.

Senator Murray: I will make an answer to that. You will be given an opportunity at the proper time to make your statement.

Senator Taft: Mr. Chairman, I am not going to attend any more meetings of your committee. We are through, and I think that every one will know that the report of this committee under your chairmanship will be a partisan report which can command no support or no respect.

Senator Murray: That is like your general conduct and you could not contribute anything to it if you did remain.

(At this point Senator Taft left the room.)

Senator Murray: Senator Wagner will now make his statement.

Statement of the Honorable Robert F. Wagner, a United States Senator from the State of New York

Senator Wagner: Mr. Chairman and members of the committee, I am very glad to appear before the committee today in support of the National Health Bill which I have introduced with Senator Murray and Representative Dingell. The bill is designed to establish a national health program along the lines set forth by the President in his message on this subject.

. . . .

(Senator Wagner described the provisions of the bill.)

HEALTH INSURANCE IS NOT SOCIALIZED MEDICINE

Some organized medical groups have criticized a national health insurance program on the ground that it involves "regimentation of doctors and patients," "lowered standards," "political medicine" and "socialized medicine" and so on. There is absolutely no foundation to these charges. Health insurance is not socialized medicine; it is not state medicine. These terms have been used by opponents of the bill to confuse the issue, which you have so emphasized.

Health insurance is simply a method of assuring a person ready access to the medical care that he or she needs by eliminating the financial barrier between the patient and doctor or hospital. Under the bill patients are guaranteed free choice of doctors, doctors are guaranteed the right to accept or reject patients, and hospitals are guaranteed freedom to manage their affairs. Specific provision is included in the bill for hearings and appeals on any issues which may arise between doctors, hospitals and covered persons. Specific provision is made for the judicial review of any disputed issues arising under the plan. It is clear, therefore, that the bill does not involve regimentation of doctors, hospitals or patients. Neither do I believe that the doctors of this country will lower the standards of medical care simply because they are guaranteed payment for their services.

. . . .

(Senator Wagner described his part in the enactment of laws governing social conditions. He said the bill safeguarded freedom of choice.)

FINANCING HEALTH INSURANCE

There is already pending before the Congress legislation to finance the cost of health insurance. On May 24, 1945 I introduced with Senator Murray and Representative Dingell a comprehensive social security bill (S. 1050 and H. R. 3293) providing for social insurance contributions for all social insurance programs. This bill was drafted on the assumption that 3 per cent of payrolls (up to $3,600 per year) would be allocated for health insurance of which one half would be paid by employers and the other half by employees. In other words, 1.5 per cent of payrolls would be contributed by employers and 1.5 per cent by employees. The bill also provides that the additional cost above 3 per cent due to the gradual introduction of dental and home nursing services would be financed out of general revenues.

I have been asked many times why the premiums for health insurance were not included in the National Health bill, S. 1606, and I should like to clarify the situation for the record.

Under the Constitution, all revenue bills must originate in the House of Representatives. This means that the House must consider and pass revenue legislation before the Senate. In order that the health insurance legislation can be considered and passed by the Senate without waiting first for House action, it was necessary to consider the benefit and revenue provisions separately.

This separation of legislation between the revenue and benefit aspects is in keeping with previous practice. In both 1935 and 1937 legislation relating to railroad retirement was considered and enacted in this way. I was one of the authors of that bill too.

Another reason for separating the benefit and revenue provisions is that under present arrangements in Congress different committees are concerned with these two matters. In the Senate, for instance, the Committee on Education and Labor handles all health legislation such as the Hospital Survey and Construction Bill, and the Public Health Service Act. The many technical problems involved in revenue legislation are handled by the Senate Committee on Finance. Similarly, in the House of Representatives health matters are handled by the House Committee on Interstate and Foreign Commerce, but revenue matters are handled by the House Committee on Ways and Means. The financial details relating to the raising of the revenue for the plan raises many special problems which have a bearing on existing income taxes and payroll contributions and should be considered in relation to these laws.

In terms of priority it is essential that the benefits should be given consideration first. If the Congress thinks that health insurance benefits should be provided, then the method of financing can be worked out in terms of the scope and character of the medical care provided.

Statement of the Honorable John D. Dingell, a Representative in Congress from the State of Michigan

Mr. Dingell: I want to confine my remarks today to the health insurance provision—title II of the bill—pending before this committee because that is the part I presume you are going to hear most about during these hearings. That is the part against which the American Medical Association and its satellite organization the National Physicians Committee has been shooting its poison gas designed for the sole purpose of confusing and misleading the American people in order to preserve the monopoly which it exercises over the health of the American people.

They have been releasing their stream of propaganda against this measure right along and laying a deadly barrage for the purpose of creating fear and confusion among the people. The object is to perpetuate a system which is outmoded. The American Medical Association—

Senator Smith: I just want to register an objection to an attack on the opponents of the bill as being wrongly motivated at this point. I am not objecting to the bill at the moment, but I do not like to start off with damning your enemies. I want to hear a constructive presentation of what is here and not what others may think about it.

Mr. Dingell: May I be permitted to ask the question whether I, as a member of the House, must come here and have a Senator purge my statement? That is my opinion, whether I am right or wrong.

Senator Murray: The Senator has concluded his objection.

Senator Smith: I did not intend to hurt the witness's feelings.

Mr. Dingell: Mr. Chairman, I submit that my opinions as contained in my statement are not subject to censorship by Senator Smith, whether he agrees with my views or not. As a member of the House of Representatives, I will not be subjected to the purging of my expressions. The statement will appear in the committee hearings unexpurgated or not at all. I am not insistent that the Senator agree with me. These statements, however, are my views.

Am I privileged to go ahead and make my statement?

Senator Murray: You may proceed.

Mr. Dingell: The American Medical Association and the National Physicians Committee have attacked the health insurance provisions of the bill as "socialized medicine," "state medicine" and "political medicine." In my opinion those who peddle such nonsense are either wofully ignorant or inexcusably rigid in their stand-pat attitude. I say this because any one who studies the bill carefully, section by section, and line by line, will find that these charges are not true.

I want to warn members of the committee that the health insurance features of this bill have been the subject of more wilful misrepresentation and misinformation than any other piece of legislation I have ever seen presented in all my thirteen years in Congress.

The National Physicians Committee, formed specifically to preserve the A. M. A.'s tax-exempt status under the income tax laws, is spending hundreds of thousands of dollars to circulate false statements to try to defeat the health insurance provisions of the bill. It is collecting money under the false pretext that contributions to it "should be deductible" from income taxes by individuals who contribute. As a member of the House Ways and Means Committee responsible for drafting our tax laws, I believe that the National Physicians Committee's statement to this effect is deliberately misleading and any such deduction is a violation of existing law which should be investigated by the Treasury Department.

The A. M. A. and the National Physicians Committee have the right to oppose this bill or any bill, to make its views known, and to spend as much money as they want to try to defeat this bill. But it should be clear that the American Medical Association in the field of medical economics does not come into the court of public opinion with clean hands. The American Medical Association's attempt to kill voluntary health insurance plans was finally stopped by the U. S. Supreme Court only after the A. M. A. was convicted of engaging in illegal activities in restraint of trade under the Sherman Anti-Trust law.

The false information which the A. M. A. circulated against the British health insurance system has been repudiated by the secretary of the British Medical Association, who said that the A. M. A. pamphlet on "Health Insurance in England" "contains only a succession of distorted and confused facts and a partisan selection of opinions. . . . Almost every page of the pamphlet provides matter for criticism on the score of inaccuracy or unfair presentation."

I predict that members of this committee, like members in the House, will be bombarded with similar false propaganda against the bill. My experience is that I cannot keep abreast of the volume of propaganda against the bill.

PUBLIC OPINION POLLS

As to public opinion polls, numerous public polls taken during the past eight years have shown that the American people are in favor of health insurance. I would like to include in the record a summary of the most important polls taken on this subject.

Last year the American Medical Association had to come out flat-footed for voluntary insurance. It finally had to be for something constructive. One of the types of voluntary insurance it now endorses is the insurance sold by private companies. The administrative costs for this kind of insurance now average about 45 per cent of the premiums. I repeat, the administrative costs for this kind of insurance now average about 45 per cent of the premiums paid by the insured. Just think of it! Forty-five cents out ow every dollar of premiums collected never come back to the beneficiary or his family in health benefits. That is not the extreme example some individual companies have administrative costs of 60, 70 or 80 per cent of premiums collected This is the tribute which an employee must now pay if he wishes to enjoy the doubtful privilege of voluntarily buying private health insurance

Irrespective of whether the individual purchases his protection from a private insurance company or through a plan controlled by a state or county medical society, he rarely gets complete medical care. Existing contracts have all the usual ifs, ands and buts in them The contract tells you when, where and how you must get sick in order to be eligible for the contract benefit. If you get sick when you only need a doctor at home or at his office, such medical care isn't covered by the contract You have to be sick enough to go to the hospital There are innumerable exclusions, limitations, deductions, exemptions of the kind you find in the small print in many health insurance policies

Let me illustrate from the voluntary plan we have in my own State of Michigan

(Congressman Dingell presented his analysis of the Michigan plan)

MR. DINGELL. Is compulsory health insurance such a radical idea as the A. M. A. and the N. P C. say it is?

If these charges are true how is it that such eminent business men as Gerard Swope of General Electric Company, David Sarnoff of RCA, and a number of other businessmen, bankers, publishers and individual doctors and dentists have endorsed compulsory health insurance as "a thoroughly American Plan, consistent with our tradition of using government to aid the people in doing things for themselves"

The principle of compulsory health insurance is no longer a partisan issue President Truman has endorsed the idea clearly and unequivocally in his special message to the Congress on a national health program

. . . .

(Congressman Dingell quoted a statement by Governor Warren)

The man who said that was Governor Earl Warren of California—a Republican I congratulate Governor Warren on his outstanding political insight He knows that the American people want health insurance He knows that the bugaboo of compulsory health insurance burst in California and that it will not scare anybody; that voluntary insurance cannot solve the problem He knows that it is good sense to advocate compulsory health insurance.

One charge made by the American Medical Association against the bill is that the Advisory Council is merely "advisory" to the Surgeon General. In other words, the American Medical Association implies that if you put a majority of doctors in control of the Council and make the Council's actions binding on the Surgeon General—why, then they would be in favor of a national health insurance plan I want to be frank about this As one sponsor of this bill I would fight with all the energy in me to prevent passage of a health insurance bill that put control of the fund under the American Medical Association or any other private organization, however reputable it may be

The charge that the Advisory Council in the bill is just a puppet Council is ridiculous Let me show you

. .

(Congressman Dingell quoted from the bill)

These provisions assure that there will not be any dictatorship or regimentation under the bill as the National Physicians Committee falsely claims

SENATOR MURRAY Thank you, Mr. Dingell

SENATOR WAGNER May I congratulate Congressman Dingell on his very persuasive statement I wish the people would read it. They would be persuaded

Statement of the Honorable Claude Pepper, a United States Senator from the State of Florida

SENATOR PEPPER Mr. Chairman, I deeply appreciate your invitation to present to the full Committee on Education and Labor the findings of the Health Subcommittee, of which I have the honor to be chairman These hearings will, I am sure, be a high point along the road to better health for all, along which the American people have been struggling for many years They are a tribute to your firm leadership, which has been discouraged by neither opposition nor delay Year after year you have joined forces with that great veteran fighter Senator Robert Wagner on his first National Health Bill Year after year you have carried to the people your message of better health for all, and you have received sustenance from them Year after year you have given unsparingly of your time to present to the people the message that better health could be achieved through a national health program This work has made it possible for us to meet here today to begin hearings on one of the most important measures before the Congress, S 1606, the Wagner-Murray-Dingell National Health Bill

. . . .

(Senator Pepper told of the work of his subcommittee and presented statistics on the need for an expanded health program)

SENATOR PEPPER The subcommittee's third interim report issued in January 1945, presented a series of facts showing the gravity of the nation's health problem Over 40 per cent of the nation's selectees were found unfit for military duty, and at least a sixth of these had defects which were remediable; many more had preventable defects

In fact, more than 23,000 000 people in the country have some chronic disease or physical impairment On any one day, at least 7,000,000 people in the United States are incapacitated by sickness or other disability, half of them for six months or more Illness and accidents cause the average industrial worker to lose about twelve days from production a year, a loss of about 600,000,000 man days annually

Let me interpolate here, I wish public opinion could become as excited about the 600,000,000 man days lost through ill health as they do about the relatively small number of man days each year lost by strikes

Sickness and accidents cost the nation at least $8 000 000 000 a year—half of this amount in wage loss and half in medical costs

Preventive services are inadequate—40 per cent of our counties do not have even a full time local public health officer Sanitation needs are great—846,000 rural homes do not have so much as even an outdoor privy Hospitals are needed—40 per cent of our counties, with an aggregate population of 15 000,000, do not have a single recognized general hospital Doctor shortages are severe—in 1944, 553 counties had less than one active physician per 3,000 population, the "danger line" and 81 had no active doctor at all Even in 1940 before many doctors were drawn off to war 309 counties had less than one active physician for every 3 000 people and 37 had no active doctor at all Maternal and child health services are inadequate—it is estimated that half the maternal and a third of the infant deaths could be prevented if known measures were fully applied Seventy-five per cent of our rural counties have no prenatal or well baby clinics at all under the supervision of state health departments State agencies had 15 000 children on their lists awaiting crippled children's care in early 1944 They do not even pretend to care for the half million children with rheumatic fever (the most killing of all diseases for children between ages 5 and 15), or for the tens of thousands of cerebral palsy ("spastic paralysis") victims

To meet such problems, the subcommittee recommended federal action with regard to certain features of a national health program, including federal grants for hospital and health center construction, sanitation, public health, medical research, education and medical care for the needy

The report also expressed dissatisfaction with the prevailing "pay as you go" or fee-for-service method of payment for medical services but withheld judgment with regard to the claims that voluntary health insurance plans offer a satisfactory solution to the problem This report *summarizes* the results of our further study of this subject and sets forth the conclusion we have reached

ECONOMIC BURDEN OF ILLNESS

Our latest report then goes on to state that the burden of sickness and medical care falls heavily and unevenly on people The burden is distributed unevenly, hitting some families so hard they are driven to financial ruin and the haunting misery which accompanies the vicious circle of poverty and ill health

Sickness is the greatest single cause of families going into debt Both national and state-wide surveys conducted by small loan companies themselves show this clearly Indeed, the results of their various studies are remarkably consistent Thus, according to the American Association of Small Loan Companies, medical dental and hospital bills are the greatest single cause of people borrowing from small loan companies This conclusion is based on the record of over 300 small loan companies Studies in Illinois and California show exactly the same pattern Further, the greatest single cause of bond redemptions, according to studies of both farm and non farm people is also sickness and medical costs

Senator Pepper: Sickness and medical costs are also the greatest single cause of people having to seek charity. Studies of public assistance rolls show this to be true, and we have conducted an interesting analysis of this point which confirms these larger surveys. Each year, as many of you know, the New York *Times* conducts a great humanitarian campaign for the "Hundred Neediest Cases" in New York City. Case histories of these needy people are published, summarizing the major facts about their cases. We found, from the brief summaries alone, that 85 per cent of the families were obviously indigent either as a result of sickness or of medical costs, or a combination of the two!

Do such barriers exist, Mr. Chairman? They most certainly do. In my part of the country this fact is so much in the experience of most families that it hardly needs proof. As I have said once before, most people in Florida no more expect hospital care during a serious illness than they do a trip to Europe in the summertime. Government studies have shown that less than 7 per cent of even the lowest income group among rural people (those making under $500 a year per family) receive any free medical care in the course of a year. Yet can it be said that farmers with mouths to feed, clothes to buy and insurance to pay can afford the $100 a year or so it costs on the average to purchase even minimum adequate medical care under our present system? They cannot and they do not. They and their wives and children go without instead.

What is the way out? The way out is prepayment, budgeting, the time tested, tried and true American way—insurance. Only through such a mechanism can these burdens be spaced out in time and over a large enough number of people to lighten them properly.

For over a hundred years the American people have been trying to insure themselves against the burden of medical costs, but they have still not reached their goal.

The voluntary payment plans have made progress since the first one began about a hundred years ago, but they still cover a comparatively small per cent of the population and take care of only a small percentage of medical services. It is also becoming clear from experience that reduced costs result from wider coverage, as in any insurance system.

At present, less than 4 per cent of the population receive complete prepaid care under voluntary health insurance plans. Seventy-five per cent of the population receive no prepaid care at all, even the most meager and partial. By "complete medical care" I mean, of course, only relatively comprehensive hospital services, and doctor's service in hospital, home and office. I do not even include dental care, home nursing and drugs. Most of the 25 per cent with some prepaid medical care are insured only against hospital bills, surgeon's bills or wage loss during sickness.

Now, as to the Blue Cross. Most of the people covered belong to either Blue Cross or commercial insurance plans. The Blue Cross plans have grown very fast in the last ten years. The latest figures show their membership to be around 20 million people. Whether they will continue to grow rapidly in the next few years or not, I am not prepared to say. Some feel that the wartime period gave the Blue Cross abnormally favorable opportunities for growth. I have been a proponent of hospitalization insurance for a long time, so I am glad that they have grown. Moreover, we should not think that they provide for more than they do. They cover only the hospital bill during ordinary illness, usually for twenty-one to thirty days, with partial payment for an additional sixty days, at a cost of about $24 per family a year. Since in any year one out of ten persons is hospitalized for the kind of illness they cover, this is important. But such hospital bills take only 13 cents (about a seventh) of the average medical dollar. The plans do not cover doctor's bills, which take about 40 cents of the average medical dollar (or three times as much), nor do they cover dental care, preventive medicine, nursing, or drugs.

Early, high quality doctor care, regular check-ups, and the like, are perhaps the most vital links in the whole medical care chain. Cancer, tuberculosis, nephritis, hernia, syphilis, arthritis, mental disease and others of our major killing or disabling diseases can be controlled only by early general practitioner or specialist care. Any prepayment scheme that does not assure their receipt has serious failings.

The commercial plans are of two major types—group and individual. Both pay specified amounts of cash toward medical expenses or wage loss; they do not actually provide medical service. The group plans represent about half the total in terms of premiums paid. Most of them do not cover the employee's family. They pay toward hospitalization for about 8 million people at present. Six of the 8 million are also eligible to receive payments toward surgeons' fees and toward loss of wages (in disabling illness lasting longer than one to two weeks). But no day-to-day doctor care is reimbursable under any but a very few of these plans, and even these are very incomplete.

The individual type of commercial policy varies tremendously, but the bulk of it consists of cash payments to the insured in the event of accident. Ninety per cent of the individual type policy premiums are for accident policies. The other 10 per cent are for sickness policies, which usually begin payment only after two weeks of sickness. They do not cover ordinary doctor or dentist care, their major aim being to replace wage loss during prolonged disability. Overhead and administrative costs are high in these plans. Only about 40 per cent of all receipts from policyholders is paid back to them as benefits. The rest goes for company expenses and profits.

Obviously, it is always the fine print in these policies that knocks the ordinary person, who thinks himself covered, out of the expected coverage.

MEDICAL SOCIETY PLANS

The medical society plans are also limited in coverage and scope. They usually cover only surgical care and obstetric service after a nine to ten month waiting period. They do not cover routine diagnosis, periodic check-ups or home and office visits. (The only major exceptions to these statements are the plans in the states of Washington and Oregon.) They cost about $24 a year per family and included about 2.2 million people in 1945, or less than 2 per cent of the population.

Senator Morse: May I interrupt at that point? I am glad that the Senator from Florida has mentioned the plan in the States of Washington and Oregon.

I am going to ask the chairman and the committee that is selecting witnesses to appear before this committee at a later date to make certain that we have some representatives from the states of Washington and Oregon as witnesses to testify in regard to Washington and Oregon plans.

I think that there is a great deal of merit in those plans, and I feel that this committee should thoroughly analyze them before it takes a position on any piece of legislation.

Senator Murray: We will be very glad to have those witnesses.

GROUP PRACTICE PLANS

Senator Pepper: Finally, there are about 3 million people who are members of prepaid medical care organizations sponsored by industry, consumers, private groups of physicians or government. These plans tend to offer the most complete care, especially the group practice plans, such as the Ross-Loos, Kaiser, Stanacola, Endicott-Johnson, Group Health and Farmer's Union in Elk City, Okla., groups. Sad to say, this is also the type of prepayment plan which was fought the hardest by organized medicine all during the thirties. This opposition is not entirely past history, despite the Supreme Court decision in the District of Columbia Group Health Association case. Complaints of discrimination against group practice prepayment plans have continued all during the war.

Now, the shortcomings of private or voluntary medical insurance:

We have therefore concluded that voluntary, or private health insurance has serious shortcomings, some of them inherent in the method itself. A few are as follows:

1. Millions of people are not eligible for any plan.
2. The plans usually meet only a small part of the health needs.
3. Many people cannot afford to join.
4. Others feel they do not need medical insurance; or they drop out after a year or so because they "didn't use the plan last year, and don't think it worth while to stay in." High turnover of membership is a constant problem and raises the cost.
5. People who are sick, or expect to get sick, tend to join the plans most. Accordingly, voluntary plans either have a tendency toward "adverse selection of risk" or they adopt such rigid eligibility requirements that they exclude the very people who need care most.
6. There is much overlapping and duplication, as well as geographical and social gap leaving.
7. There is a tendency to high promotional and administrative costs.
8. The plans are not well suited to the needs of our increasingly migrant population.

9. With very few exceptions, they have not provided consumer representation on their policy making boards.

Next, Mr. Chairman, the tax assisted voluntary plans.

These defects in private insurance became apparent quite early in our study, and we began to believe that subsidies from tax refunds might overcome them and obviate the necessity of a completely tax based program. We were fortunate in discovering that experiments along these lines were already in progress, under the postwar program of the Department of Agriculture. Accordingly, we studied this experience very carefully. We have recently issued a monograph embodying the major lessons of these plans. I have already drawn this monograph to the attention of the committee members, and it is available to the interested public.

What we found was that tax assisted voluntary plans do not offer the basis of a national pattern. They remained subject to what are apparently the inherent defects of voluntary health insurance, although subsidy had obviated certain other defects.

Each plan took the form of a voluntary health association open to all farmers in the country. They offered relatively complete doctor, dentist and hospital care to the whole family, within the limits of availability and quality prevailing in these counties. The total cost of the services was $45 a year, but government subsidy succeeded in reducing the actual charge to the family to $20, with a minimum payment of $13. Yet, despite these low charges and every evidence of good will toward the experiments by the people, only 40 to 50 per cent of those eligible to join actually did so. Turnover was considerable.

Let me say our committee spent a lot of time and a great deal of effort in trying to determine whether it was possible to provide adequately for the health needs of the people of this nation by any kind of voluntary plan.

We honestly endeavored to canvass every suggestion and every experiment that was in progress in the whole country. We considered all kinds of compromises and all sorts of meetings of the minds of the various diverse groups in an effort to find some voluntary system that would give the needed help and hospital care to the people of the country, and it was our conclusion that none of these plans will afford coverage to the nation as a whole. You can cover a certain number, of course, but you can cover a certain number by voluntary insurance or commercial insurance, but if you are going to cover the whole nation, we have concluded that a national health program, based on compulsory insurance, is the only way by which it may be achieved.

There is much experience both domestic and foreign on which to base such a program. A few years ago we would have demanded information in detail on how such systems operate in other countries. Now our temper seems to be different. The tides of nationalism have swept so high it almost discredits a speaker to state what foreign experiences and opinions are. I wish only to observe the following: During my recent trip to Europe I talked with many people in many countries about their health organization. In practically all cases I found them planning to increase the percentage of the population covered and the scope of the medical benefits offered under their health insurance plans. The more democratic the country, the further advanced were the plans, for example, England and Czechoslovakia. In no case was there any desire to give up health insurance and return to the fee-for-service system.

Actually we do not have to go abroad for experience in this subject; for a certain section of the population it has been the "American way" for a long time. Ever since 1798 our merchant seamen have received their medical care through services supported by social insurance and tax funds in a program administered by the U. S. Public Health Service. It first began through the payroll deduction plan which, as late as 1874, was called by the Public Health Service's Surgeon General "a peculiarly American institution." I think there would be a tremendous storm of protest if the Congress attempted to take this program away from the seamen.

While this is a specialized experience, and of course does not represent the same pattern as one for the whole nation, it is rewarding for us to learn from this experience that the health insurance idea was not planted in our heads by Bismarck or any one else, but dates in our government from almost the beginning of the Republic.

Would the public support the view that neither voluntary plans nor tax assisted plans can do the job, and that a national plan, based on the social security and tax mechanisms can do it? How do the people feel about these matters? We are their elected representatives, and we need to know. Our mail is one way of finding out.

I, for one, have been impressed with the thoughtful, original note struck in the letters to me which favor this bill. I have likewise been struck by the fact that the great majority of letters opposed to it are from medical society representatives or doctors. I have no doubt that the opponents are quite sincere, but it is difficult not to stress that many of them simply parrot unsubstantiated slogans issued by a propaganda organization, financed to a great extent by certain "patent medicine" manufacturers, namely the National Physicians' Committee. This committee is a successor to the so-called "Physicians' Committee for Free Enterprise"; in turn a subsidiary of the Committee to Uphold Constitutional Government. You will undoubtedly have an opportunity to hear statements of the sort this committee issues during the course of these hearings. You can judge their merit.

Another way of learning what the people think is through the public opinion polls.

. . . .

(Senator Pepper quoted interpretation of various polls)

To summarize this part of my testimony, I would like to quote from the conclusion of the subcommittee's health insurance report:

"To cover every one, the adverse as well as the good risks, the young and the old, the sick and the well, the rural and the city dwellers, the low and the high income groups, the poor and the rich areas, all this takes a mechanism as representative and all inclusive as the federal government. Some people will not protect themselves voluntarily even if they are able to do so; others will be able to afford to do so only under a national plan. A national solution by spreading the risk among the whole population, and by equalizing costs between income groups and areas, will enable all the people to protect themselves at a cost they can afford to pay.

"The voluntary plans have served and are serving a valuable purpose, even though they do not provide any final answer to the problem of prepaid medical care for all the people. They have developed useful data on the prepayment of medical costs and have educated large sections of the public on the value of medical care insurance. Furthermore, they have trained sizable numbers of medical and administrative personnel in the technics of prepaid medical care. There is no reason why such plans should not continue to perform useful functions within the framework of a national health insurance system.

"It is our considered opinion, reached after months of careful study, that the only way complete care can be brought to all is through a national health program, built around a system of prepaid medical care. It must be financed by required contributions to the social security fund and by payments from general tax revenues. Such a program will satisfy all the requirements set forth above and will make possible the achievement in the foreseeable future of our goal of high quality health care for all."

SENATOR SMITH: Will the Senator yield for one little statement?

SENATOR PEPPER: Yes.

SENATOR SMITH: I appreciate the care in making this report, but I must object to it appearing as the considered opinion of the committee, because, so far as I know, I have never been asked to attend any meeting or to discuss these measures with the subcommittee. I might be prepared to go along with them, but I have never been asked my opinion on them; therefore I would like in the record that is to appear that until now I have never been considered or asked to consider these issues presented by the able Senator from Florida.

I want to compliment him on the very extensive surveys made. I think the findings of fact have been most important, but I question that we should show that the committee has arrived at conclusions until we have got together and had a meeting and decided to agree on the report.

SENATOR PEPPER: The able Senator from New Jersey is quite correct in calling attention to the fact that there has not been a formal approval of this report by the committee in its publication by the committee. It has been prepared by the staff with the collaboration of members of the committee. It has now for some weeks been in all of the hands of the members of the committee, and the majority of the members have communicated to the chairman their approval of this report. It was that that led me to leave the inference that it had committee approval, but the Senator is quite correct in saying that, in its final form, it has not formally been adopted as the formal report of the committee.

SENATOR SMITH: He has done a spendid job here, but I think it should appear, without my taking issue, there are very controversial questions, not as to what we want to accomplish, but there are issues as to the way that should be accomplished.

SENATOR PEPPER: That is correct.

SENATOR SMITH: I think it is fair and proper that I should be recorded as yet not convinced of the wisdom of the solutions asked for here and simply have that appear in the record. I am open to conviction, and in these hearings I hope to come to a conclusion with the committee. I hope it can develop a fine, sound, overall national health bill.

SENATOR MURRAY: It is proper that your position should be made clear in the record.

SENATOR PEPPER: I am glad you made that clear.

"The cost will not be greater than that of our present inefficient and wasteful fee-for-service system. According to leading experts, the charge to the average family under a national health insurance program will actually be less than it pays now, partly because the employer and the government will both contribute to the fund. It is noteworthy that the labor organizations, all of whose members are wage earners, are among the stanchest supporters of national health insurance.

"Health insurance is often erroneously called 'socialized medicine' or 'state medicine.' As President Truman pointed out in his health message, such a system is one in which the doctors are employed by the government. We do not advocate this. National health insurance, which we do advocate, is simply a logical extension of private group health insurance plans to cover all the people. It is a joint national endeavor. It will guarantee free choice of doctor or group of doctors and free choice of hospital by the patient, and free choice of patient by the doctor. Indeed, free choice will be extended, because current financial barriers to the actual exercise of free choice will be broken down.

"Some aspects of a national health insurance program are, of course, experimental. No legislative framework or administrative plan can be perfect at first. Shortcomings will undoubtedly be uncovered, but they will be overcome as we learn from experience. None of these shortcomings, however, will be anywhere near as costly as the toll of lives and health now being exacted by our failure to have a national health program providing good medical care for all. The need for it is urgent.

"The concern of the federal government in this matter is clear. If only the national defense were involved, this would be reason enough for the adoption of a national health program. The costly lessons of the selective service rejections and of the armed forces medical discharges have made this apparent.

"Today America faces the challenge of world leadership. To a very large extent we bear the principal responsibility for the kind of world we are to live in. America can continue neither prosperous nor secure unless her people are healthy and full of strength. We owe it therefore to the nation and to every man, woman, and child in it to open to every citizen the door to the marvels of modern medical care. Only thus can we make our full contribution to a free and happy world, unhindered by the heavy drag of sickness and ill health."

MATERNAL AND CHILD CARE

Now, although compulsory national health insurance is the rock bottom minimum requirement for an effective national health program, there are certain other aspects of health which such insurance cannot cover. Most important of these additional aspects, in my opinion, is the problem of adequate maternal and child care, particularly for the families who are not covered by the provisions of S. 1605, but to a lesser extent for those who are, but will not be able to obtain adequate services for such care under existing circumstances.

I have long had a particular interest in the health and welfare of mothers and children. Last year, I introduced (for myself and Mr. Walsh, Mr. Thomas of Utah, Mr. Hill, Mr. Chavez, Mr. Tunnell, Mr. Guffey, Mr. LaFollette, Mr. Aiken and Mr. Morse) Senate Bill 1318, whose purpose is to provide for adequate maternal and child health and crippled children's services and child welfare services in all the states.

Although all of the provisions set forth in S. 1318 are not specified in this bill to which we are not addressing ourselves, some will be included through amendments which are being proposed. S. 1318 would provide a unified program of health services and medical care of high quality for all mothers during maternity and for all children, administered by the Children's Bureau through grants to state health agencies. It is, in my opinion, imperative that these services be assured to mothers and children under a comprehensive plan. Under the amendments proposed, it will be possible, though not mandatory, for the federal agencies and the states to place responsibility for all such services in the same state health agency. I earnestly hope that if this legislation is enacted policies of administration will be adopted to assure the attainment of these objectives and the continuing leadership of the Children's Bureau, to which the nation which loves its children is so much indebted.

The section of S. 1318 which covers child welfare services is not being considered in the national health program. This is a loss that must be made up promptly in some way. Child welfare services must also be carried forward as part of the total service to the nation's children in these postwar years. It is folly to make provision for children when they are physically or mentally sick and not make comparable provision for them when they are in need of social services. I am sure the committee will welcome further suggestions from witnesses who are particularly concerned with the health and welfare of children.

I am pleased that public responsibility for the health of mothers and children is now being discussed as part of S. 1606. For instance, the provisions which control sanitation and other environmental conditions in the interest of the health of all people in the community are particularly important for children. The communicable disease control clauses are equally important, for such diseases are no respecters of age or person—children and adults catch things from each other. The saving of parents' lives through the insurance medical care plan in this bill means that fewer homes will be broken up and more children given a normal life.

The purpose of our deliberations is to formulate sound public policy with respect to the many problems involved in a program of health and medical care. There must be funds to pay for the medical care which is given to individuals. Doctors, dentists and nurses, as well as hospitals and health centers, must be within reach of every individual, regardless of his race, color or creed. All persons in the population must be covered in one way or another. The long established policy of the expenditure of public funds by public agencies responsive to the will of the people must be continued.

Let me reemphasize that we have a special stake in our children as the future of our nation. If the time of their childhood runs out before something is done for them, we cannot retrieve what has been lost. There must be no distinction between the medical care provided for children of insured and noninsured individuals.

Under this proposal for a national health program, the President has placed major responsibility for the financing of personal health service benefits on the insurance fund, with coverage based on employment. The President, however, has set before us a complete objective in terms of children—"that no American child shall come to adult life with diseases and defects which can be prevented or corrected at an early age," and that the "health of American children, like their education, should be recognized as a definite public responsibility."

I am calling your attention, therefore, to the limitations on benefits and coverage within the insurance system which will affect children. Premature infants, for example, may need hospital care beyond sixty days, and therefore beyond what can be paid for under the prepaid personal health service benefits of this act. Some children will be ineligible for benefits, because neither of their parents has meet the conditions of employment prescribed for coverage. In order that all children may receive full health and medical care, certain amendments are being proposed to title I, part B, which will assure care for those excluded from title II, and provide the additional care needed by all beyond the limitations imposed in the insurance section.

The benefits which an individual receives under the insurance provisions will necessarily depend on the medical facilities in the place where he lives. We know that the kind and quality of medical care which can be obtained by mothers and children at this time varies greatly from state to state, and between city and farm. We also know that, on the whole, health and medical care is less plentiful and of an inferior quality for the minority groups and for migrant families. The purpose of including a maternal and child health plan as part of the national health program is to assure that health and medical care of good quality will be made available to mothers and children—whoever they are, wherever they live, whatever their income.

Under title I, part B, the state health agency will keep informed about qualified doctors, dentists, nurses, and other professional people to whom parents can take their children. If there are places in the state where good medical and hospital care is not available for mothers and children, the state health agency will arrange for it. Sometimes this will mean taking steps to encourage doctors and dentists who have skill in providing care for mothers and children to locate in certain areas. Sometimes it will mean setting up community clinics, to be financed from maternal and child health service funds. It may mean working out a school health program in a local community, covering all children through high school. Such a program will include correction of defects found at the medical examinations. The ingenuity of the state health agency will be directed to the task of making it possible for mothers and children to have access to the services of specialists and to modern methods of care as they need them.

All this will be worked out within the maternal and child health program as a service in the community. There will be planning by the state health agency with the schools and other community agencies, and with the government agencies paying for personal health services for insured mothers and children. The work will be coordinated with the hospital and health center construction program to be sure that the special needs of mothers and children are met. Opportunities will be created for doctors, dentists, nurses and others who are serving mothers and children to become more skilled in the handling of their special problems through postgraduate education. A good program can go forward only as fast as trained personnel becomes available.

Unless there is a centralized responsibility for overall planning, the objective of complete care for every child—preventive, diagnostic and curative services linked together—will almost certainly fail. I want this kind of care for mothers and children to become a reality. I am sure there are many millions of parents in this country who agree with me in this. It is our goal to accomplish this in the next ten years.

I want to give you briefly just one example of what will be done under the maternal and child health program. Figures show that about 5 per cent of the total number of babies born in any one year are born prematurely. Approximately 30 per cent of the infant deaths in the first year are attributed to premature birth. There are many practical steps which are necessary if we are to save the greatest possible number of these babies' lives. There must be special nursery units equipped with incubators and special heating arrangements in all hospitals taking maternity cases. There must be incubators available in the health centers for use in the baby's home when he is not born in a hospital. Special ambulance service is necessary to take a premature baby to the hospital. Nurses and doctors must be given special training in the care of premature infants to provide the services needed. Specialists who can give consultant service must be within reach. It will be a responsibility of the state health agency, in accordance with its approved state plan under title I, part B, to see that each and every one of these steps is taken.

Under a national health program of which insurance is the cornerstone, it is of the utmost importance that there be a sustained effort on the part of public agencies to make sure that medical care of good quality is available for use. I am glad that the sponsors of this bill have included title I, part B, which provides grants to states for maternal and child health services under the direction of the Children's Bureau, which has been responsible for the setting of standards for maternity care and for the health and medical care of children under the Social Security Act.

I have been intimately acquainted over a period of years with the work of the Children's Bureau in the health and welfare fields, and know that its primary concern is the public interest. It has striven consistently for health and medical care of good quality for all mothers and all children and youth. The Children's Bureau is now responsible for the administration of the Emergency Maternity and Infant Care Program under which well over one million wives and babies of service men have been given care during the war. The Children's Bureau will bring to an extended maternal and child health program the wisdom of its past experience.

. . . .

(Senator Pepper read proposed amendments in behalf of maternal and child welfare)

SENATOR PEPPER: Let me add only that those amendments are proposed after long consultation and most sympathetic cooperation among the sponsors of the two bills. I happen to be one of the sponsors of the Maternal and Child Welfare bill and am in favor of its passage, but I am equally strong in my support of the pending measure, the Wagner-Murray-Dingell bill, and we have worked together, the Children's Bureau and others who are sponsors of the Maternal and Child Welfare bill, so that these amendments might be fitted into 1605, and if 1606 should be adopted, then it would cover, essentially, what appears in the Maternal and Child Welfare bill also.

If the unfortunate event should occur that 1606 should not be adopted, when then, of course, 1348, the Maternal and Child Welfare bill can be considered as a separate matter.

The Honorable JAMES E. MURRAY (Chairman), Presiding.

Present: Senators Murray, Ellender, Aiken, Morse and Stanfill.

Statement of Watson B. Miller, Federal Security Administrator

MR. MILLER: Individually and as spokesman for the Federal Security Agency, I stand squarely behind this program. It is necessary. It is practicable. It is long overdue.

(After repeating some of the general points made in Senator Pepper's statement, Mr. Miller said that he wished to endorse not only the extension of general and specific public health services it envisages but also its provisions with respect to grants-in-aid.)

. . . .

It is to the interest of the entire country to remove, as the bill proposes, the present statutory limitations on the appropriations that Congress may authorize for public health grants to the states. It is equally to the interest of all to employ a formula permitting variation in federal grants for this purpose within the range of 50 to 75 per cent, according to the fiscal capacities of the several states.

. . . .

If specific legislative provision is to be made for maternal and child health care and for services to crippled children, these measures for dealing with this need through grants-in-aid on a variable formula seem appropriate. We have, as you know, accepted the amendments to this portion of the bill proposed by Senator Pepper. The proposal to make federal financial aid available to the states to help them provide medical care for needy persons is generally sound and desirable. The provision that state and local agencies may arrange to have this care furnished to the needy through the health insurance system which the bill would establish seems to me particularly important. It would have the advantage both of encouraging better care for the needy and of promoting more effective coordination among the several parts of the national health program.

But the main provision for individual medical care contained in the bill—and indeed the backbone of any national health program worthy of the name—is a system of prepaid personal health service benefits to cover the majority of the country's workers and their families. The provisions for this purpose in title II are in accord with the President's recommendations and are, on the whole, workable. This applies to methods of administration as well as to the system of benefits itself. Appropriate safeguards, for example, would assure, as the President has rightly insisted, that people remain free to choose their own physicians and hospitals, that doctors remain free to accept or reject patients and to participate in the system full time, part time, or not at all. Speaking for myself, and with deep personal conviction, I would not be a party to any plan which intruded between the physician and the patient or failed to preserve and guarantee the professional independence of medical practice.

Since ready access to medical care for people in all parts of the country is the prime purpose of such a system, another point on which there is general agreement is that administration should be decentralized as far as practicable and that the state and local governments should assume their full share of administrative responsibility. State and local participation in administration would follow the pattern already well established by our existing public health services. If this pattern were to be continued with respect to the system of prepaid personal medical care, it would have the great advantage of building on a very solid base of experience and of promoting the effective coordination which is essential as between community preventive services and individual care.

. . . .

As the bill is at present drafted, three large occupational groups would not be automatically eligible for these benefits—railroad workers, federal employees and state and local employees—though for some of these groups special arrangements for participation might be made by their employers. I should like to see at least federal workers and railroad workers brought within the automatic coverage of the system. In the case of state and local employees, action of state legislatures might be necessary.

SENATOR MURRAY: Mr. Watson, it is charged by some that this insurance program proposed in this legislation is socialistic. Have you anything to say about that?

MR. MILLER: I wish that I understood more about what the term means. I realize that the words "socialized medicine" have been used so much and sometimes carelessly, I think, that it has almost become a dictionary term. I think that we are a social nation, and as far as this proposal being a socialistic one, it cannot be more than democracy in its greatest aspects because this program cannot be inaugurated, and if it was inaugurated it could not flourish without the consent and support of the American people. If democracy means socialism, I accept the soft impeachment.

Senator Murray: Do you think that it is a proper function of the government to undertake a program which will be of such benefit to a large section of the country that at present is unable to secure the medical care and attention necessary for the preservation of its health?

Mr. Miller: Lincoln had a lot of quaint methods of expressing truisms. Once he said that his conception of government was to do for the people only the things that they were unable to do for themselves. I have great pride in the advance of American medicine, and I think perhaps you and the other Senators here present, some of you at any rate, will know that for perhaps two decades before coming to the government I at least stood on the threshhold of medicine, although I had brains enough not to try to invade it or try to practice it or prescribe for people. However, I learned something, as much as a layman should be trusted about medicine, and I have great pride in American medicine and American medical people and the advances in research and in the understanding of ideologic factors and diagnostic procedure, and of course the very marvelous and brilliant advance of therapeutic measures. Nobody is more zealous than I am for the high ethics of American medical practice. I would not be a party to attempting to force down the throats of American medicine anything that was not right and anything that would not be right; but I believe, with all of the advances which have been made and with a fairly certain knowledge of the successes and failures of the voluntary systems, that now is the time for the central government to spearhead this effort. I think that we can no longer wait.

. . . .

Senator Murray: Would the establishment of such a system as here proposed be of benefit also to business and industrial interests of the country?

Mr. Miller: Without doubt. I think that the figures of absenteeism were rather completely exposed to the committee by one of the Senators, perhaps Senator Pepper, but I have pulled together a few figures here. In the critical year of 1942, our first full year of war, illness in one way or another cost American industry 4,000,000,000 work days, the equivalent of a full year's working time for 13,000,000 people, or more than the total strength of our armed forces.

Senator Aikin: You say that 4,000,000,000 work days were lost in the full year in the war from illness?

Mr. Miller: Yes.

Senator Aikin: Do you happen to know how many days were lost by strikes in the same period?

Mr. Miller: I have read the figures but actually I do not have them off hand. This figure breaks down into 500,000,000 lost work days of absenteeism caused by illness and accident, the equivalent of 1,000,000,000 lost days due to permanent disability, and a billion and a half due to premature death, and still another billion attributed to the reduced efficiency of those who stuck on the job when they were really too sick to work. Somewhere around 7,000,000 men and women in this country are too sick to work on the average every working day in the year. The price we paid for sickness and disability in 1943, the wages lost by workers and the costs to business added up to not less than $15,000,000,000.

Senator Murray: Thank you, Doctor, for your statement here this morning. I am sure that it will be of benefit to the committee.

Mr. Miller: I regard these hearings as the most momentous that I have been privileged to attend in two decades or more.

Senator Aiken: I was interested in Dr. Watson's observations on socialistic ideas. Am I right in the understanding that when a so-called socialistic idea is approved by the majority of the people, through their duly elected representatives, that in your opinion it becomes part of our democratic processes no matter what it was called before?

Dr. Miller: I do not think that it can fail to do it, the electorate having the right to reverse themselves.

Senator Aiken: So long as it expresses the desires of the majority of the people, you would call it a democratic process?

Dr. Miller: Using the term in its best sense, although I am a member of the party that spells it with a capital letter.

Senator Aiken: The first socialism that I heard of was when I was just old enough to remember it, when it was first proposed to have the R. F. D. routes established, to have the mail delivered to the country people the same is it was to city people, and the charge of "socialism" was made against the R. F. D. at that time. And then the parcel post was a socialist idea, and then the postal savings bank: that was definitely socialism. But according to you, when it was accepted and voted for by the majority of the people, I understand that you would take it out of the realm of socialistic ideas, out of that category?

Dr. Miller: Still admitting that I do not understand the word "socialism," that it may be rather a complex mosaic, I am not sure that I would recognize a communist and I hear that name a good deal, if I saw one behind the gooseberry bush in the garden. I think that this would be democracy in action. It is pretty difficult for people to realize that, when Selective Service came along, that really was not a drafting, using the term in its most objectionable sense, but a spectacle of the entire nation volunteering, and that is what it came out to be.

Senator Aiken: That was established 150 years ago, I would say.

Senator Murray: The free public school system was very bitterly opposed in this country when it was first proposed; is that right?

Dr. Miller: Yes. There is so much evidence and I do not want to detain the committee too long. Medical students who have gained their medicine through tax-supported institutions have never objected to that as far as I know, and that could well be termed "socialized medicine" or "socialized medical instruction." We have a social country here.

Statement of Dr. J. W. Mountin, Medical Director, U. S. Public Health Service

Dr. Mountin: Dr. Parran is now in Europe, serving on a committee to form an international health organization under the U. N. O. He has delegated me to appear in his stead and to express to you the point of view of the Public Health Service.

. . . .

Yesterday the authors of the bill gave us their interpretation of the bill. They told us also that other measures to complement or to complete the President's program were contained in bills before the Congress.

. . . .

I should mention some other legislation which is not directly related to personal health services or medical care in the restricted sense of the word. I refer particularly to sanitation legislation, particularly those bills that are designed to remedy the rather disgraceful pollution which goes on now of our streams and coastal waters.

Senator Aiken: Is there any program being worked out to eliminate stream pollution? Is your agency working with other government agencies on any program to eliminate stream pollution through the country? I agree with you that it is disgraceful, and it is also unprofitable to let it continue.

Dr. Mountin: A specific program of remedial measures, no, but studies are now going on and surveys; but what is needed is legislation which will take us beyond the study and the survey stage into actual aid on the construction of needed facilities.

Senator Aiken: I have not heard this matter mentioned by any witness up to now, and I am particularly interested in it because I think it is one of the most important undertakings that the country can embark upon. When we see our little streams polluted as they are, carrying disease and spoiling the fishing, it strikes me that it would be one of the most profitable undertakings that we could engage on, not only from the health standpoint, but from the recreational standpoint, the industrial standpoint and from every other standpoint. It could be worked in in some cases with flood control. It is so very important that it is a mystery to me why we have not been doing something about it before now and why we delay any longer in undertaking it.

Dr. Mountin: In addition to the points that you have raised, Senator, one is still more serious, and that is on account of the pollution now going on. Many of the streams that otherwise would be suited for sources of water supply are just rendered not available for that purpose. It is a serious economic situation, and I am perhaps dragging this in.

Senator Aiken: It is tied in with the entire subject of rural sanitation as well as urban sanitation.

Dr. Mountin: That is right. At the outset, I should like to record that the Public Health Service is heartily in sympathy with the type of program that is envisaged by this bill, S. 1606.

(Dr. Mountin submitted a prepared statement for the record. He then discussed the public health aspects of the bill.)

Dr. Mountin: The other point that I would make at this time is in the nature of an amendment. The act as it is now written limits public health services to the ordinary preventive work of health departments, health education and what we commonly speak of as communitywide services. We would recommend that that definition be expanded so as to include the support of hospitals for communicable diseases; that is already included, but beyond that chronic diseases and especially tuberculosis and mental disorders. These conditions are excluded, virtually so, from the title II of the bill, and I would say appropriately so. It leaves them without any federal participation.

Senator Aiken: They are not covered under other legislation?

Dr. Mountin: No, sir, except in a general way. There is in the Tuberculosis Control Act a provision where tuberculosis could be supported. The sums, however, are only sufficient to carry on a case finding and general preventive work. There, perhaps, is authority for that.

Senator Aiken: If it appeared that this bill would not be enacted into law, would you favor existing legislation to cover the situations which you have just presented to us?

Dr. Mountin: Tuberculosis could be covered under existing law, but I would question whether we could take in the mental hospitals. We had a mental bill before the Senate, but that features research and community clinics in the interest of mental hygiene in that order.

Senator Aiken: You mean the bill that we have already had hearings on before this committee?

Dr. Mountin: That perhaps could be handled by some clarification of the language. There is definite need for bringing the federal government into that picture. Now, the states are required to support these institutions themselves, there is wide variation among the states, and the extent to which they have developed these institutions, and that variation is determined directly by their economic resources. That is true of many tuberculosis hospitals as it is of other aspects of medical care.

The second part of that title, that is, part *b*, provides grants to states for the support of maternal and child health services. It is my understanding that the Children's Bureau will give testimony later on this phase of public health work, and I shall not go into it in any detail.

Yesterday, you will recall, Senator Pepper introduced certain amendments which would more closely integrate this feature of the bill with the other parts of it and incorporated some of the features of the bill which he had introduced for the child health services.

The point I wish to make and to stress is the essential unity of public health services, which should be maintained at federal, state and local levels, and that essential unity includes financial support, administration and the actual delivery of services.

At the present time we have rather the anomaly of two of our important health agencies set up in different departments of the government, the Children's Bureau in the Department of Labor and the Public Health Service in the Federal Security Agency. Perhaps that separation has not been so important in the past because the sums of money at our disposal in each agency were not large, and in any event they were brought together at the state and local levels, the funds. But now we are going into much larger sums, we are expanding the scope of the service and the need which had not existed previously for closer integration will be increased many times. So it is my understanding that the governmental reorganization is now being considered by the President, and perhaps this is not the occasion on which to discuss the details of that reorganization, because it is not part of this legislation. However, I hope that I am not out of order in saying that we hope that this committee will consider that and hope that a good bit of this reorganization would be accomplished soon, and, if not, perhaps certain features of this administration would have to be reoriented in the light of the prevailing structure.

There is no question about the need for additional maternal and child health services. It will also be true, I think, in respect to other phases of public health, that while they need to operate within the general framework, or the same general framework of organization, they will be part of the program at different stages of its evolution which will need to be sharpened up and more closely focused on problems which may be more emergent at the moment. In the past, maternal and child health services certainly needed it and still do. The other parts of the bill focus on venereal diseases and mental hygiene and there is now a broad field coming in which is geriatrics.

Senator Aiken: This may not be the time and the place, as you said, Doctor, but do you think that health, security and education are closely related so that they could well be administered under the same head, or maybe you still think that this is not the time and place to answer that?

Dr. Mountin: Of course, there are phases of education which have little or no relation to health, and for the most part they do not. There are phases of education, however, that are closely identified.

Senator Aiken: You have got medical inspection in the school, and dental correction, which you can hardly separate from education.

Dr. Mountin: I would hope, when this bill is enacted, that that phase which you would hardly call education but a service to a particular age group, and commonly administered by a school health department, would be brought into this general scheme of organization. I might say too, Senator, that the need for developing it in the educational framework has largely risen out of its neglect in the health framework. The health people had no provision for doing much about these defects of childhood, little was done on location of them, but following through to the correction, it had not been done. And educational departments, quite appropriately, stepped into the breach and have endeavored to make up for the deficiencies in the health organization. I think, as we develop and piece out those deficiencies, the need for education in the administrative picture will lessen.

Now, there is another phase, of course, of health in which we will need the educational framework very much, and that is what we call health education. A large part of that very definitely should be carried out through the framework of administration for education. That is such things as supplementary feeding through school lunches and that sort of thing. Obviously, that is more closely identified with the educational function.

Senator Aiken: We know, that, when a child has good health and good eyesight, the work of the truant officer is cut down, and the work of the sheriff is probably cut down in later years.

Dr. Mountin: That is right.

Senator Aiken: I was a school director for fifteen years in my town, so I know that when children are healthy they study better and they learn more, and I have felt for a long time that we should have a new department of the government covering it. I wanted to find out how far you thought we should go and how much you should include under such a new department if it should be established, as I hope it will be.

Dr. Mountin: I am not at all sure that I could speak with any degree of competence from the federal level, but I was speaking of the integration of services at the operating level.

Senator Aiken: I do not see how you can separate child health from education.

Mr. Watson Miller: Could I interject there that the President is making some studies of reorganization, there is an agreement between the Secretary of Labor and myself, that functionalizing should be brought together. As to the exact complexion of such pulling together, we have nothing to offer at the moment because the matter is now being considered downtown for later presentation to the Congress.

Dr. Mountin: I started to mention another phase of specialization in public health, just by way of interest. That is that there is a broad field of what they speak of now as geriatrics, in which many medical men are specializing and which I anticipate will grow in importance. So to speak, it complements pediatrics. Pediatrics deals or has to do with the conditioning or the growing organism for the environment in which he lives, the developing organism. Geriatrics will condition the declining organism to the environment in which he has to live. We have altogether too many people now dying at 45 largely because they have not learned how to live with their infirmities and how to adjust to declining physical resources.

There is another title, and another part in title I, on grants made to states for medical care for the needy. Mr. Altmeyer will give testimony on that tomorrow, and there is just one passing comment that I would like to make, and that is I will hope too that the provisions of the act that are now just merely mentioned express a *preference for integrating this* with the general medical care program. I am hoping that that will be carried out because it would be a mistake, *eventually*, as this thing gets going to set them *apart*, the *needy apart* from the general population. It would be unwise socially and administratively too, I think.

Suppose that I just change the *order* here *a* bit *and say* a word about grants for education and research. First, let me mention research, that any medical care program and any *human enterprise, and this is* especially true of medical care, is bound to become sterile and routinized and spiritless unless there is infused into it a well thought out and aggressive and a *substantial* plan of research. And this bill very wisely sets or *makes* provision for that, a specific amount for the first two years, and then thereafter a percentage of the personal health service fund.

There *are innumerable subjects that* need to be explored. There is, for example, the cold, the most common of human ailments, and we are utterly helpless in doing anything about it that is really effective. There is another malady that is universal. I refer to the very common *condition of dental* decay.

Senator Aiken: What diseases are on the increase?

Dr. Mountin: Those of later life. They are cancer, diabetes, heart diseases; those are three striking examples.

Senator Aiken: Are they *increasing in actual numbers or* percentages?

Dr. Mountin: They are increasing in actual numbers and in percentages too, but let me explain: The population is aging. There are more people over 65 than before, and more over 45 than before, and we are reaching what we speak of as the cancer age. They are reaching the age when they die or when *the heart starts to give out or when the arteries become brittle.* Because of that alone we would naturally expect more people to be dying of those conditions and to be afflicted with them.

Senator Aiken: What is the status of arthritis? Is that increasing? The reason I ask that is, a *good many servicemen* call on us in getting asistance in regard to a larger disability allowance or help in some way because they are suffering from arthritis.

Dr. Mountin: *Arthritis is a group of diseases: almost any*thing that happens to a *fellow's* muscular and skeletal *system* that causes pain on movement, and we present that through *the broad term of "arthritis."*

Senator Aiken: Is *it on* the increase?

Dr. Mountin: Perhaps not except in respect to the age factor. The joints become less mobile, the muscles less pliable, as we get older, and because of the increasing age of *the population they are at a corresponding increase* in arthritis. Arthritis, I should say, while it is not a prominent cause of death, shows up in the causes of death. *It is one of the most disabling of* conditions. It *looms* up very large in the total illness burden and in the total disability burden too.

Senator Aiken: Would it *naturally* increase as the result of the war?

Dr. Mountin: It might. *Exposure of* those under combat *conditions might* have caused some increase. I wouldn't know. *I want to say this about research*: Research needs to be carried *on on many* fronts. There is fundamental knowledge that needs *to be developed*. There are fundamental facts that need to be disclosed dealing with the broad questions of physiology. Then there are new remedies that we *need*. *Many of* our remedies are very unsatisfactory. There are preventive measures that we know nothing about.

* * * * * *

Now, on education too I am hoping that the committee will see fit to include and retain that. I am speaking *now* more particularly of medical *education*, because I have some familiarity with that over and above the other professional groups that are involved. Medical education is a very expensive *process*. *It costs the school* alone some *$1,200 or* $1,500 a year to train a medical *student*. Tuition returns to the school some $400 or *thereabouts*; roughly one third. Now, the remaining $800 has got to be secured from some place. *Up to now* we have been able to draw very largely on endowments, but as a *resource endowments* are not as generous or as *satisfactory* as they should be. I am not including in *that $1,200, please* understand, Mr. Chairman, any of *the personal* cost of the student, bed and board *and clothing* and so on. I am only talking about direct educational cost.

Medical education, *many think*, is really facing a crisis because of the cost, unless something like this can be done, and *because of the long* process of education, the high tuition and *personal expenditures* of the individual. Many of the boys of limited circumstances, I am afraid, *just will not* be able to *go to school* unless these costs can be reduced, and perhaps *something can be set up in the* way of fellowships. Now, I might add to that, *it so happens, I think, that there* are some twelve or *thirteen state schools*. The remaining schools are supported by endowments *and* tuition. So you can see the rather critical *stage—which we are not in now*, exactly—the rather critical circumstances which we are *likely to face in* regard to medical education.

There is another phase of education which is perhaps the most neglected of all, and that is picking up the doctor after he has graduated from school, is out in practice, and providing for his continuing education. Many of the *things* he learned in school he will *forget if he does not have the opportunity* to put them into practice continuously. New remedies are coming in; new diagnostic procedures, new *instruments*; *and he needs to have the opportunity to refresh himself on* that work. Otherwise, deterioration will just go on, and very fine doctors, as they now are when they come out of our medical *schools*, *will be not so good rather shortly unless there* is some scheme provided which will afford opportunity for conregard to medical education.

The full significance *of this bill, I* do not believe, is quite realized. We do a lot of *talking* and *arguing* as to whether or not it is going to improve the quality of *medical care or* whether it is going to deteriorate or whether the doctors are *going to be satisfied and a lot of other points like that; and* the true import, I think, is somewhat overlooked. There is a definite philosophy in this bill, and it is this: heretofore the *individual* has had to *finance his own cost of illness himself* out of pocket. Now, this *is an attempt to change that process* or change that arrangement, and, so to speak, lift the cost of illness off the backs *of the sick people and to place it on the* broad shoulders of society, so to speak. It is somewhat analogous to the change that was made in the support of education upward of a century ago. Now, I think that is, we all should realize and appreciate, a fundamental change in our philosophy; and I say that not to cause you to shudder at all but to appreciate our *developing thought, our social* consciousness and the wider uses of government framework to carry out the will of the people and to provide essential services which now they can only provide for themselves *through their own* resources.

Dr. Mountin argued in behalf of government assuming costs of illness and distribution of medical facilities.)

Senator Ellender: Doctor, do you *think* that the passage of this *bill would* stimulate the building of more hospitals by private concerns or do you think it will be necessary for the Congress to provide funds to expand these facilities?

Dr. Mountin: There are two elements necessary to correct *the condition.*

Senator Ellender: I understand that. You have gone through that.

Dr. Mountin: One is in this bill and another *in another* bill.

Senator Ellender: We passed the Hill-Burton bill some *time ago.* Do you think the funds provided in that bill would be sufficient to meet the amount necessary to take care of this should this bill go through?

Dr. Mountin: *The ceiling price on that appropriation* somewhat limits its usefulness, in the sense that I have some doubt as to whether it will cover the whole need, but it will go a long way.

Senator Ellender: *The point* that I want to make is that if you provide our citizenry with the funds and the doctors and everything else you may be lacking in facilities to meet the emergency so that they can get *adequate hospitalization.*

Dr. Mountin: *The two need to go on* together.

Senator Ellender: Together; yes.

Dr. Mountin: We have a fund to *aid in* construction. We have a fund to help pay medical cost. The construction fund, however, was designed to meet only one expense, and that is the *construction* expense.

Senator Ellender: I understand.

Dr. Mountin: But the operation of a hospital *annually* is something in the neighborhood of a quarter to *a fifth of its original construction* cost, so you have an annual expenditure which needs to be met; and that would be accomplished by this prepaid medical service fund that title II seeks to establish.

Senator Ellender: Well, you do not think that fund would be sufficiently large, do you, so as also to take care of the facilities? The scheme worked out in this bill.

Dr. Mountin: Not unless is was incorporated. And then, furthermore, I think that the initial capital outlay is an appropriate item for direct appropriation. I would think that that would be better than having some one assume the risk of building a hospital and trying to liquidate his obligation by an excess charge on the service rendered there.

Senator Ellender: Would you venture an opinion as to the amount of public money that would be necessary in order to provide sufficient facilities to make this bill workable, as you have just said it ought to work?

Dr. Mountin: I do not have the figures in my mind. I think those were given to the committee at the time of the hearings on the Hospital Construction Act.

Senator Ellender: I thought maybe you had them.

Dr. Mountin: No, I do not have them at the moment. I am sure they have been given; or, if not, we will see that they are. I mentioned that many of the preventable diseases that loomed up large as causes of death at the turn of the century have now pretty well been conquered. We are now confronted more and more with the diseases of older life that require a high degree of medical skill, high development of physical facilities and a staff organization for diagnosis and treatment. And, therefore, we need to improve health further.

It has been alleged that doctors will be surrendering whatever freedoms they have, they will be subjected to an overall government authority, that hospitals cannot operate or might not be able to operate as they think appropriate; in other words, that it is a thoroughly regimented system that is proposed here. I fail to see that in the bill. It is true that it does provide for a federal fund. The details of finance are not spelled out in the bill, but, as I would infer, it contemplates payroll deductions, a direct tax on income of self-employed people; and contributions to the fund from other groups that might seek to utilize this mechanism for the performance of their medical care. Now, that part of it is centralized. I see no way of decentralizing it except by considering an entirely different bill: a series of state plans or some aid of one sort or another to voluntary organizations or something entirely different from what we have before us. Without something like that before us, I am unable to discuss it.

Senator Ellender: Have you given thought to another plan to make it more or less on a voluntary basis instead of an obligatory deduction of 3 to 4 per cent, as I understand this bill provides?

Dr. Mountin: Up to 3 per cent, but that is incorporated in other legislation. What is it? 1050?

Senator Murray: Another bill. It was originally in this bill and it was separated.

Dr. Mountin: Another bill. Well, the use of voluntary agencies brings up another question, and that is, if the federal government makes this deduction and collects these taxes and a fund is established, then it would seem to me that the federal government has a responsibility for seeing that the benefits enumerated in the act are actually delivered. I am afraid that if they are not delivered the average citizen would not care to take as an excuse "Well, we expected somebody else to do that," the states or the locality and, if they failed to do it, to present their claim to them. I am quite sure that they would come to the federal government, which had collected the money and maintained the fund. Can voluntary effort take care of it entirely by itself; is that the point you wish to make?

Senator Ellender: Yes. Of course, I have not made a very close study of the bill. I read it casually, and that is one of the features of the bill I am opposed to; I will be frank in saying that. I was in hopes that we could work out some voluntary method of doing it. And I am wondering the extent to which you and others have studied these voluntary methods.

Dr. Mountin: We have studied them rather extensively and intimately. Voluntary effort is going on now, of course.

Senator Ellender: Could we employ that in some way? Have you given it thought?

Dr. Mountin: It could be employed, certainly; but the question is, Is that the best way of going at it? Should we prop up voluntary effort or face the whole job and use the framework of government for accomplishing it?

Senator Ellender: Personally, I would much prefer our devoting some time to trying to find a voluntary method rather than to have the government have its hands in it. I would want us to be removed from it, if we could.

Dr. Mountin: I understand your point of view, Senator.

Senator Ellender: That is why I was so insistent on the Congress providing sufficient money to build a system or a chain of hospitals throughout the country and let that be the extent of our obligation, and through the voluntary system make it so that these obligations are taken care of, let the hospitals be utilized for the purpose which you say is necessary for good health. Now, what plans on a voluntary system, if any, have you worked out that you think will be workable and that will improve the present voluntary system?

Dr. Mountin: There is no clearcut plan that we have to present to you at the moment. We have thought of that possibility. You have not one voluntary organization but literally hundreds of thousands of them.

Senator Ellender: Yes.

Dr. Mountin: You would have to deal with that number or by some process of elimination get down to a smaller number or, perhaps, give an exclusive franchise, using that term, to some one. That process would be a rather painful one, and I am not sure it could be accomplished. I think they would all seek federal funds. In fact, that has been the experience in foreign countries. You do not set up one; you set up literally hundreds of them. How to discipline and how to get a national program through thousands of agencies organized under a variety of offices with no direct responsibility, as most of them now are, to any elected official; it would be truly a herculean task. They could be propped up here and there, perhaps.

Senator Murray: Doctor, if the voluntary system would have to be financed by the federal government, then it would not be a voluntary system.

Dr. Mountin: Then it would not be a voluntary system.

Senator Ellender: What I have in mind is that, if we provide the money for the facilities, it strikes me that the communities ought to be willing to make use of those facilities by interesting themselves in this voluntary plan of insurance, as is now in effect in many communities. In other words, the thing that bothers me about this is that it will eventually lead into the government's taking charge of it. And in the long run, when this bill gets well in effect, it might be so broadened as to have some bureaucrat up here from Washington, maybe of a different type from my good friend Miller here, to take charge, and it may be a little hard on the medical profession. This is just a start, you know.

Dr. Mountin: Well, this goes quite a ways, too.

Senator Ellender: It goes almost the full way from the beginning.

Dr. Mountin: Yes.

Senator Ellender: And that is the part I do not like.

Dr. Mountin: It is quite comprehensive.

Senator Ellender: Oh, yes.

Dr. Mountin: And, in fact, if we have any criticism, I should have voiced that criticism earlier in my testimony; that it does not go the whole way. It takes in 80 to 85 per cent of the population now, either directly or indirectly.

Senator Ellender: What is left out? What does the 15 per cent represent?

Dr. Mountin: There are some enumerated here: government employees, railroad groups, state employees, and religious bodies and a few others, making up about 15 per cent.

Senator Ellender: Yes.

Dr. Mountin: Although some of them could be brought in by compact.

Senator Ellender: Why were they left out?

Dr. Mountin: I know of no reason, from the standpoint of the delivery of medical service. As a matter of fact, I should like to see them brought in. I believe there are other reasons, tied in with the basic Social Security Act. Is that correct?

Senator Murray: The theory would be that they would be permitted to come in.

Dr. Mountin: That is right.

Senator Murray: As you say, by compact

Dr. Mountin: That is right.

Senator Murray: That was the hope and the expectation.

Senator Ellender: Is that through the Railroad Act, Senator Murray?

Senator Murray: That was because they already had a system; and the desire was to avoid forcing this on them unless they voluntarily come in and announce it under an agreement.

Senator Ellender: Does the same thing prevail as to federal employees and state employees?

Senator Murray: No. They would, of course, be entitled to come in under the act as it is unless they had some system similar to the railroad system: If they had, then they too would come in under a compact.

Senator Ellender: The only reason why those were left out, then, as I understand it, is that they already have some system of their own?

Dr. Mountin: That is not true of government employees. It is tied in with the basic Social Security Act. It is covered in the Social Security Act, as I understand it, the other benefits of the Social Security Act.

Senator Murray: The studies that have been made of voluntary systems have come to the conclusion that it would be impossible to have a voluntary system that would cover the country adequately to give the American people the service that they should have in modern care.

Senator Ellender: As I was just informed by Mr. Miller, one of the reasons why state officials were not put in was because of inability of taxing them from a constitutional standpoint.

Dr. Mountin: I think that was one of the reasons.

Senator Ellender: But the bill has covered as many as it is possible to cover under the law; is that it?

Dr. Mountin: I believe the railroad people could be brought in, and government employees, by Act of Congress. Is that correct, Mr. Chairman?

Senator Murray: Surely.

Senator Ellender: Let us put it this way, then: As to all those that have a system of their own, and as to the others left out, the reasons you do not have them in are because of legal reasons?

Dr. Mountin: I do not think that is quite correct. I think the government people do not have a system of their own.

Senator Ellender: I said as to those that have systems of their own.

Dr. Mountin: With respect to voluntary agencies, the voluntary insurance schemes of themselves under the present scheme of arrangement and the present scheme of financial support, I think we can say categorically that there is no hope of their setting up, carrying on a comprehensive, exclusive type of medical care program. The only way that they might do it would be an extensive scheme of public support. It is conceivable that that might be accomplished. Then there is a big question of public policy, as to whether the government wishes to assume its own risk, as it does in other enterprises, or whether it would attempt to discharge an obligation through an organization that it has to support; and, taking it from experience abroad, eventually support it for the most part too.

Senator Murray: The voluntary systems that have been set up all vary in amounts?

Dr. Mountin: Oh, yes.

Senator Murray: That would then be a very difficult situation for the government to undertake to finance them or aid them.

Dr. Mountin: I would assume we would have to be required to have a uniform type of benefits, and that would change the existing situation very much.

Senator Murray: And the study seems to indicate, then, that one single system administered by the government would be the most effective system.

Dr. Mountin: That is right.

Senator Ellender: Well, there is no doubt about it, to cover all. If you could get it and impose it on them and force them to it you would accomplish your end. The point I am making is, I do not like to go that far. It strikes me that, as to those unable to get medical care and attention, something should be directed for them. That is, we should go as far as the traffic will bear so as to see to it that those unable to pay get the proper medical attention. But in your effort to do that you cover everybody in the country, and those left out are those you really cannot reach, as I understand the bill.

Dr. Mountin: I think there are a few points here that are a little bit misunderstood. That is, first of all, the question of imposing this on anybody. I would assume, in our democratic process, that the people will express their will at these hearings, and that when Congress votes on it it will be a reflection of the will of the majority of the people.

Senator Ellender: What I mean by imposing is, if I am an employee, I want to do it my way, and the government will just take from me 3 or 4 per cent, whether I want it to or not.

Dr. Mountin: If it would be the will of the majority I would presume we might regard it as an imposition.

Senator Ellender: You mean enacted through Congress?

Dr. Mountin: This could not be enacted except through Congress, and it obviously would be the will of the people. The next point I think I should make clear is that it is not proposed here that the government set up a whole arrangement of facilities throughout the land, hospitals and health centers, which it would directly operate, and that physicians would be placed on the public payroll and certified as to specialty and all the rest of it, that that would be carried out by government decree. This only has to do with the financing, and it seems to me that the bill is now sufficiently safeguarded. Or, if the committee or Congress so sees fit to throw in additional safeguards with regard to making it clear that it is the facilities that now exist or that might be brought into being because of the better scheme of finance utilized in carrying out the provision of the act, we can do so. Now, I would say that it is true that in the act certain authorities are set up. The Surgeon General happens to be mentioned here, the position, as the principal figure in the administration.

Senator Murray: Some have suggested that the bill setting up the Surgeon General and providing for the administration of this act would create a dictator under the Surgeon General. Have you studied that?

Dr. Mountin: I hope that we humble servants in government have not risen to that position. We have always regarded ourselves as the humble servants of the people and responsive to the will of Congress. I hope that that is our record.

Senator Murray: Is there anything in the bill that would permit him to become a dictator?

Dr. Mountin: He is appointed by the President; he has to be confirmed by the Senate; he is under the control of the administrator, who sits in the government and in the President's cabinet; he has to make a report to Congress annually; he has to come before it for his appropriations; and I am sure that if anything went wrong and a substantial body of citizens or even a few individual citizens had complaints, I am sure Congress would very quickly transmit those to us, as it does on occasion, and ask us to come before it and give an account of our story.

Senator Ellender: Doctor, I have been in the Senate ten years, and I can give you a little inkling of the "cloakroom gossip" to the effect that many of these laws are discussed for certain purposes and administered in such a manner that some of the authorities in Washington—some of them call them "bureaucrats"; I guess that is a good name for them—do many things that Congress never dreamed of. And this bill as expressly drafted; you may say all you want is that the purpose is "this, that, and the other," but you will find in its administration that a lot of fellows who have charge of it usually go beyond the pale of what Congress had in sight. I have had a few instances myself, in recent months, with my good friend Mr. Miller. I will not go into that. It has been worked out to some extent but not to what I think it ought to be. Anyway, I do not believe all of us are satisfied with some of the action taken by OPA from all you hear in the paper and over the radio.

Let me ask you this question: you say that the beneficiaries of this plan would have the opportunity of selecting a doctor of their choosing?

Dr. Mountin: Certainly.

Senator Ellender: And it would be paid out of that fund?

Dr. Mountin: Certainly.

Senator Ellender: Suppose it was necessary for me to be operated on, and I selected a doctor whose charges were about four times what you say it should be, what then? Would I be permitted to select that doctor who would charge four times as much as the fee you might fix or agree to?

Dr. Mountin: The arrangement, as I interpret it, would be that the authority here, who we will say is the Surgeon General.

Senator Ellender: Yes.

Dr. Mountin: Of course, he would not look into every case.

Senator Ellender: Yes.

Dr. Mountin: That agreements would be entered into with doctors in states and localities with respect to methods of payment and to a range of fees that would take into account not alone the kinds of service that the patient required but the degree of competence and skill that are necessary in the performance; and within those restrictions what you would get out of the fund should pay your bill.

Senator Ellender: Well, of course, as you know, we have a lot of doctors here in Washington. In fact, I know we have in my own state. They will perform, say, a removal of tonsils, where the rate might be $50, but in order to get that skill you speak of I would not want to trust this $50 doctor; I would want one who would charge $150, because of that skill he has. Because you want to do it cheaper than that, he would either have to pay the difference or else he would have to agree to pay whatever fees the administrator recommended. Am I right?

Dr. Mountin: If in your particular case you had a very unusual case of bad tonsils, and that it required a very unusual degree of skill, I would expect that that would be provided for.

Senator Ellender: Doctor, the point I want to make is this: you know yourself that you have in all communities famous surgeons, famous lawyers, who work, who might do the same work for a citizen, but charge considerably different from what that citizen could obtain from other sources. Is that not true?

Dr. Mountin: It is true, and I might even say unfortunately true.

Senator Ellender: I see. In other words, what would happen, as I see it, is this: You would fix a system of fees that could be charged by the doctor who is in business for a year the same as one who has been in business twenty-five years and has acquired that skill.

Dr. Mountin: No, that is not so. I think in my earlier statements I provided for the kinds of contingencies or situations you have been describing.

Senator Ellender: Does the law provide for that?

Dr. Mountin: Yes; it says that the Surgeon General shall arrange with physicians and groups of physicians as to rates of pay, methods of pay.

Senator Ellender: Are the amounts fixed?

Dr. Mountin: The group of physicians are certified as to the competence of their members, and then adjustment of these rates of pay is made as to the competence of the individual.

Senator Murray: Doctor, you have not referred to the National Medical Advisory Policy Council, which has been set up here, and the work that the Advisory Council has done in establishing professional standards.

Dr. Mountin: That is what I had in mind in making those remarks, but I want to say one more point, Senator, and that is that under the present scheme of remuneration physicians now give a lot of service for less than they really should get, because of the economic circumstances of the patient. That is a high proportion, 25 or 30 per cent, that many physicians give of their time to charity service.

Senator Ellender: That is free work.

Dr. Mountin: In order to compensate for that work that they give free, or for less than what it is worth, they frankly have to overcharge those that are in better economic circumstances. I think that is unfortunate. I do not blame the physician. I just say he is the victim of a circumstance. I think with this arrangement that while some of these very high fees would be leveled down some it would not be uniform. That is ridiculous. That is not thought of in the bill at all. It would be most unjust, and it would be stultifying if it was incorporated in the act. But leveling out the fees at the bottom you will find that the total income of physicians should be increased under this scheme of support as is contemplated in title II of the act.

Senator Morse: Doctor, is it true that the Veterans Administration is at the present time trying to encourage the treatment of veterans by doctors in their local communities?

Dr. Mountin: I understand they are working out those contractural arrangements as may be feasible. I do not have the details. I understand somebody from the Veterans Bureau is coming later. Is that not right, Mr. Chairman?

Senator Murray: Yes.

Dr. Mountin: I do not have the details, but I know from reading that they are endeavoring to work out those contractural arrangements, utilizing local doctors, local hospitals, in the localities where the veterans live for certain types of conditions.

Senator Murray: You may proceed with your statement.

Dr. Mountin: I am about through. I wonder if I have overlooked any point.

Senator Murray: Would you explain that advisory council which is to be set up under the bill, and what its jurisdiction would be?

Dr. Mountin: Well, it provides that the Surgeon General shall set up at the federal level an advisory council. I do not have the exact wording, but in general the council shall be representative not alone of the professional bodies but of the institutions that are concerned with care, and with groups that are concerned with receipt of service; so we have both the point of view of the producer and the recipient of service. The act also requires that he shall consult with the council on matters of policy, and that he shall report to Congress on the use that he has made of these councils. It provides for regional councils that parallel the national one in many respects, so that you have that balancing of authority. It is not exactly authority, but that participation, I should say, of professional and consumer groups all the way down the line in the administration of the act.

Senator Ellender: Who selects this council? Does not the Surgeon General do that?

Dr. Mountin: Appointed by the administrator, I think.

Senator Ellender: The administrator. So that he could have people of his own choice?

Senator Murray: It is on page 41, section 204.

Dr. Mountin: Approved by the Federal Security Administrator.

Senator Murray: But they are selected from panels of names submitted by the professional and other agencies.

Dr. Mountin: That is right. "The sixteen appointed members shall be selected from panels of names submitted by the professional and other agencies and organizations concerned with medical, dental—" and so on. So the nominations, so to speak, sort of come up from the groups.

Senator Murray: With that kind of circumstance it would not be possible for the Surgeon General to set himself up as a dictator, as he is required to take advice from this Council on matters of policy and he has to make reports to it.

Dr. Mountin: I do not see how he can. As I said before, I have been in the government upward of thirty years, about twelve of that time here in Washington. And we feel that we are accountable to Congress, and I hope that our record with you is such that you can say that we have been responsive to your will. I can see no reason why, simply because we are dealing with somewhat larger sums of money than we have in the past, why our relationship with you should be changed in the least. You certainly have the authority to "bring us to book" any time you see fit. I know you do it; and we are glad you do.

Senator Ellender: You don't have as much power now under the Health Service as the administrator would have under this bill.

Dr. Mountin: Well, unless you put money and power in the same category, or say that money is power,—

Senator Ellender: You will not disagree with that, will you?

Dr. Mountin: As far as I was concerned, I think we have felt the same degree of responsiveness to Congress, and in fact I know they have looked more intimately into our affairs than when we were the small Marine Service. I am sure they will look still more intimately as we get into this type of service relationship with the general population.

. . . .

(Remaining questions related to Dr. Mountin's interpretation of the costs of service and fixing of fees, the Advisory Council, and so on.)

(To be continued)

National Health Program

PLATFORM ADOPTED BY THE AMERICAN MEDICAL ASSOCIATION

One of the ten points in this platform will be published each week.

1. The American Medical Association urges a minimum standard of nutrition, housing, clothing and recreation as fundamental to good health and as an objective to be achieved in any suitable health program. The responsibility for attainment of this standard should be placed as far as possible on the individual, but the application of community effort, compatible with the maintenance of free enterprise, should be encouraged with governmental aid where needed.

Official Notes

INCORPORATION OF ASSOCIATED MEDICAL CARE PLANS

The Secretary of State of Illinois on March 30 issued a certificate of incorporation under the General Not For Profit Corporation Act of Illinois to Associated Medical Care Plans. The new corporation is a national organization which will include all state and local medical care plans that comply with the minimum standards for medical care plans approved by the Council on Medical Service and Public Relations of the American Medical Association.

The objects of the new corporation as set out in the articles of incorporation are broad. They embrace a variety of activities, which can be expanded as future experience and developments may indicate. Specifically, the authority granted by the state of Illinois permits the new corporation "to promote the establishment and operation of such nonprofit, voluntary medical care plans throughout the United States and Canada as will adequately meet the health needs of the public and preserve and advance scientific medicine and the high quality of medical care rendered by the medical profession of the two countries." Significantly, the corporation recognizes that "state and local medical care plans should be autonomous in their operation so that the needs, facilities, resources and practices of their respective areas can be given due consideration, but that the health and welfare of the public is advanced by the coordination through the medium of this corporation of methods, coverages, operations and actuarial data."

The actual activities that are at present contemplated are indicated by the specific duties that the proposed by-laws impose on the commission of the corporation, which, in effect, is the corporation's board of directors. The commisson is directed to undertake and promote:

(*a*) Research and compilation of statistics with special studies of experience and collection and distribution of financial and service data.

(*b*) Consultation and information services based on contacts with existing and contemplated plans concerning administrative policies and procedures, and the distribution of significant literature and information.

(*c*) Public education by interpreting the national scope and significance of the medical care plan movement under medical society auspices with publicity methods suitable to the various groups in the public and yet consonant with proper professional practices.

(*d*) Coordination and reciprocity among plans with reference to transference of subscribers and benefits in the development of national enrolment among large enterprises and authoritative contacts with governmental or national agencies such as Farm Security, welfare and industrial groups.

The necessary details dealing with the manner in which these duties will be performed are matters that will evolve from future meetings of the commission and of members of the corporation. To expedite the initiation of corporate activities, a meeting of the commission has been called for April 26 and 27 in Chicago from which will emerge considered operational plans. These will be presented for approval to the first meeting of the members of the corporation, now tentatively to be held in San Francisco the two days immediately preceding the annual session of the American Medical Association in July.

Among the more pressing of the matters on the agenda of the commission for its April meeting is the acceptance of applications for membership and the appointment of an executive director to administer the day by day activities of the corporation. Plans, at least temporarily, call for the establishment of an office, with necessary administrative and clerical staff, in the headquarters building of the American Medical Association, thus facilitating coordination of the activities of the new corporation and of the Council on Medical Service and Public Relations of the American Medical Association.

The following men are serving as indicated on an interim basis until the membership can elect officers at the corporation's first annual meeting:

President—F. E. Feierabend (Surgical Care, Inc., of Kansas City).

Vice president—William M. Bowman (California Physicians' Service).

Treasurer—Norman M. Scott (Medical Service Plan of New Jersey).

Secretary—Jay C. Ketchum (Michigan Medical Service).

Commissioners—Willard C. Marshall (Oregon Physicians' Service), Edwin M. Kingery (Iowa Medical Service), Arthur J. Offerman (Nebraska Medical Service), L. Howard Schreiver (Ohio Medical Indemnity), Lester H. Perry (Medical Service Association of Pennsylvania), Herbert H. Bauckus (Council, Medical Society of State of New York), Raymond L. Zech (Council on Medical Service and Public Relations, American Medical Association), A. W. Adson (Council on Medical Service and Public Relations, American Medical Association), Edward J. McCormick (Council on Medical Service and Public Relations, American Medical Association).

Medical Legislation

MEDICAL BILLS IN CONGRESS

Department of Children's Welfare

Representative Luce, Connecticut, proposes by *H. R. 5260* to establish at the seat of the government an executive department to be known as the Department of Children's Welfare to have jurisdiction over the activities of the government relating to the health, educational opportunity and welfare of children in the United States. This bill, among other things, would transfer all functions, powers and duties vested in and imposed on the Secretary of Labor and the chief of the Children's Bureau with respect to the health, educational opportunity and welfare of children to the secretary of the new executive department proposed by this bill.

Water Pollution

H. R. 6024, introduced, by request, by Representative Mansfield, Texas, proposes a comprehensive program for the prevention and control of water pollution, including grants-in-aid or loans to states, municipalities and other public bodies for the construction of necessary treatment works.

Control of Barbiturates

S. 1986, introduced by Senator Bilbo, Mississippi, has been reported to the Senate with recommendation that it pass, proposing to regulate the manufacture, sale, distribution and use of the barbiturates in the District of Columbia. This bill would amend the existing narcotic law applicable to the District of Columbia by including the barbiturates among the drugs covered by it.

Miscellaneous

Representative Hope, Kansas, has introduced H. R. 5925, a bill to improve nutritional standards, reduce the cost of food distribution, provide a broader outlet for American farm products and promote scientific development of food processing, distribution and marketing by establishing a National Food Research Institute. H. R. 5909, introduced by Representative Rogers, Massachusetts, proposes to amend the Servicemen's Readjustment Act of 1944 by providing that any veteran entitled to a prosthetic appliance shall be furnished such fitting and training, including institutional training, in the use of such appliance, as may be necessary, whether in a Veterans Administration facility, other training institution or by outpatient treatment, including such service under contract. The veteran will be entitled to necessary traveling expenses and such per diem allowances as the administrator may determine, to the place or places of such fitting or training. Senator Pepper, Florida, has submitted S. Res. 244 proposing an additional appropriation of $50,000 for use by the Subcommittee on Health and Education of the Senate Committee on Education and Labor for further studies and surveys of the distribution and utilization of health personnel, facilities and related services. The Committee to Audit and Control the Contingent Expenses of the Senate has reported this resolution after reducing the appropriation to $40,000.

STATE LEGISLATION

Massachusetts

Bills Introduced.—H. 1185 proposes that all bottled medicines and tonics containing alcohol or drugs of any description shall be labeled in English so as to show the percentages of such ingredients. H. 1287 proposes to increase the scope of an existing special commission to include matters relative to establishing a medical school at the Massachusetts State College.

Bill Passed.—H. 1132 passed the senate April 2. To amend the law relating to actions for personal injuries, it proposes that a physician or surgeon who makes a physical or mental examination of an injured person in connection with any claim for damages for personal injuries shall be deemed to be the agent of the party for whose information the examination was made for the purpose of answering interrogatories.

Mississippi

Bill Introduced.—S. 46 proposes the creation of a memorial hospital commission to operate a war memorial hospital having a polio and cancer clinic and equipped to do research work in cancer and other diseases.

Bills Passed.—H. 430 passed the senate March 27. It proposes the creation of a Mississippi Commission on Hospital Care to set up and administer a statewide plan for the construction, equipping and maintenance of hospitals, nurses' homes, health centers, clinics and related facilities and in conjunction therewith to prepare a statewide hospital plan and to conduct all necessary studies and surveys incident to developing such a statewide hospital plan. H. 699 passed the house April 3. It proposes to authorize the state board of examiners to proceed by injunction to prohibit any person from practicing any profession licensed under the supervision of said board when such person is not duly licensed so to practice, except persons practicing chiropractic, osteopathic or veterinary sciences. H. 712 passed the house March 29. It proposes to provide for the incorporation of medical, surgical and other corporations organized for improving the physical, mental and moral condition of mankind. H. 1038 passed the house March 26. To amend the law relating to the hospitalization of charity patients, it proposes to increase the amount payable for hospitalization and surgical care and to provide that no hospital shall receive any funds provided for by this act unless such hospital shall have been inspected and approved by the state board of health.

Missouri

Bill Passed.—S. 343 passed the house March 26. It proposes the creation of a bipartisan board of six members to be known as the Missouri State Board of Medical Examination and Registration to register and license persons for the practice of medicine and surgery, midwifery and chiropody and proposes further to transfer the records now in the possession of the department of medical licensure of the state board of health of Missouri to the Missouri State Board of Medical Examination and Registration.

New Jersey

Bills Introduced.—A. 259, to amend the law relating to the practice of chiropody, proposes to add certain types of advertising to the grounds justifying the revocation or suspension of a license to practice chiropody. A. 262, relating to the practice of chiropody, proposes that no corporation formed for the primary purpose of practicing chiropody shall continue to practice and that no person shall practice or continue to practice chiropody as an officer, agent or employee of any corporation formed for the primary purpose of practicing chiropody or practice chiropody under any firm name or trade name or under any name other than his own.

Bills Passed.—A. 47 passed the assembly March 29. It proposes the establishment in the executive branch of the state government of a state department of health, the chief administrative officer of the department to be the state commissioner of health, who shall be a duly licensed physician, a graduate of a regularly chartered and legally constituted medical school, with at least five years' experience in the actual performance of public health duties, and with skill and experience in public health administration and sanitary science. A. 147 passed the senate April 1. It proposes that the holder of a license to practice a profession, the license or registration certificate of which was forfeited or lapsed because of the passage of time while the holder thereof was in the armed forces, shall be entitled, without examination or reexamination, within six months after his discharge, to a renewal or reinstatement of such license on payment of the lawful fee. A. 164 passed the senate April 2. To amend the medical practice act, it proposes an addition to the Board of Medical Examiners of a chiropodist to have equal rights and privileges in all matters affecting chiropody. A. 171 passed the assembly April 2. It proposes the creation of a Bureau of Cancer Control under the supervision of a director who shall be a duly licensed medical physician in the state qualified by training and experience to direct the work of cancer control and competent to administer cancer clinics. The bureau would establish four cancer clinics within the state, each one under the direction of a duly licensed medical physician.

New York

Bill Passed.—A. 2769 passed the house and senate March 26. To amend the code of criminal procedure, it proposes to authorize the judge of a court to appoint psychiatrists and qualified psychologists to attend such court when in the opinion of the judge such appearance might be necessary.

Bills Enacted.—A. R. 68 was adopted March 21. It provides for the creation of a joint legislative committee to make a survey and study of the social, educational and physical problems of individuals afflicted with cerebral palsy, with special attention to those whose muscle involvement is commonly referred to as (1) spasticity or (2) athetosis or (3) ataxia, and including those who have similar central motor or sensory defects. S. R. 22 was adopted March 26. It provides that the joint legislative committee to study nutrition problems is hereby further continued with all its powers and duties as contained in the original resolutions and that such committee shall submit its report, together with such legislative proposals as it may deem necessary, on or before March 1, 1947. Such investigations shall include a nutritional assay of a cross section of the children of the state, of expectant mothers, of factory and office workers and of the entire population. S. 821 has become chapter 320 of the Laws of 1946. To amend the penal law in relation to the right to dissect the dead body of a human being, it provides that the husband, wife or next of kin of the deceased, when authorizing a dissection, shall do so by written instrument which shall specify the purpose and extent of the dissection so authorized. S. 986 has become chapter 353 of the Laws of 1946. It provides for the creation of a temporary state commission to examine into the need for and to make recommendations relative to the creation of a state university.

South Carolina

Bills Enacted.—S. 101 has become chapter 818 of the Laws of 1946. It requires every physician attending a pregnant woman for a condition relating to pregnancy to take or cause to be taken a sample of her blood at the time of the first examination and to submit that sample to an approved laboratory for a standard serologic test for syphilis. S. 124 has become chapter 780 of the Laws of 1946. It provides for the creation of a South Carolina Hospital Commission to make a complete survey of the hospital, health centers and other related facilities in the state and to file reports and recommendations concerning the same to the next session of the general assembly.

Virginia

Bills Enacted.—H. 378 has become chapter 344 of the Laws of 1946. It provides regulations for the creation of local hospital or health center commissions. S. 64 has become chapter 355 of the Laws of 1946. It provides for the creation of a commission on postmortem examinations and the appointment of a chief medical examiner, who shall be a skilled pathologist and eligible to be licensed as a doctor of medicine. The chief medical examiner is to be provided with an office and laboratory having adequate professional and technical personnel and physical facilities for the conduct of postmortem examinations and of such pathologic, bacteriologic and toxicologic investigations as may be necessary or proper. Coroners throughout the state shall be appointed from a list of two or more licensed doctors of medicine submitted by the component medical society of the county or city in which the appointment is to be made. S. 238 has become chapter 281 of the Laws of 1946. It provides for the use in court of a certified clinical psychologist defined as a person skilled in making Binet-Simon or other approved mental tests and certified as a certified clinical psychologist by the commissioner of mental hygiene and hospitals.

Council on Medical Service and Public Relations

PREPAID MEDICAL CARE NEWS

Florida Medical Service Corporation Charter Approved

The application for charter of the Florida Medical Service Corporation has been approved by the state insurance commissioner, and the board of directors has been appointed. Florida Medical Service is a nonprofit corporation sponsored by the Florida Medical Association to provide a prepayment medical care plan for the people of the entire state.

In the beginning the plan is expected to offer surgical, obstetric, x-ray, laboratory and anesthesia benefits for in-hospital patients. Enrolment will be limited to groups of five or more persons. The suggested monthly premiums are: subscribers, 80 cents; family, $2, with a family defined as husband, wife and all unmarried children under 19 years of age.

The plan is a combination service-cash indemnity type. The income limits above which additional charges are permissible are $2,000 for unmarried subscribers and $3,000 for married subscribers. However, an additional charge may also be made to any subscriber "who shall (voluntarily) request and occupy private room accommodations in the hospital."

Administration will be handled by the Florida Hospital Service Plan.

The county medical societies have been asked to furnish (on a pro rata basis) the amount of money necessary for the corporation to function. The money will be advanced as a loan, with no interest, to be repaid when and if possible.

The officers and directors are Dr. Leigh F. Robinson, president; Dr. Walter C. Jones, vice president; Rev. E. D. Solomon, secretary; Dr. Frederick J. Waas, treasurer; Dr. W. Shaw, Dr. Duncan McEwan, Dr. Eugene G. Peek, Dr. Walter C. Payne, Dr. William M. Rowlett, Dr. Harrison A. Walker, Dr. Robert B. Harkness, Dr. Herbert C. White, Dr. Herman Watson, Mr. Dewey Dye, Mr. A. R. Cassidy, Mrs. Mildred Wells and Sister Loretta Mary.

Coming Medical Meetings

Alabama, Medical Association of the State of, Birmingham, April 16-18. Dr. Douglas L. Cannon, 519 Dexter Ave., Montgomery 4, Secretary.

American Association for Thoracic Surgery, Detroit, May 29-31. Dr. Richard H. Meade Jr., Kennedy General Hospital, Memphis 15, Tenn., Secretary.

American Association of Plastic Surgeons, Toronto, Canada, June 3-4. Dr. Frederick A. Figi, 102 Second Ave., S.W., Rochester, Minn., Secretary.

American Association of the History of Medicine, Atlantic City, May 26-27. Mr. W. B. McDaniel II, 19 S. 22d St., Philadelphia 3, Secretary.

American Broncho-Esophagological Association, Chicago, May 31. Dr. Paul H. Holinger, 700 N. Michigan Ave., Chicago 11, Secretary.

American College of Physicians, Philadelphia, May 13-17. Mr. E. R. Loveland, 4200 Pine St., Philadelphia 4, Executive Secretary.

American Federation for Clinical Research, Atlantic City, May 28. Dr. Richard H. Lyons, University Hospital, Ann Arbor, Mich., Secretary.

American Gastro-Enterological Association, Atlantic City, May 24-25. Dr. J. Arnold Bargen, 102 Second Ave., S. W., Rochester, Minn., Secretary.

American Laryngological Association, Chicago, May 29-30. Dr. Arthur W. Proetz, 3720 Washington Blvd., St. Louis 8, Secretary.

American Laryngological, Rhinological and Otological Society, Chicago, May 27-28. Dr. C. Stewart Nash, 277 Alexander St., Rochester 7, New York, Secretary.

American Otological Society, Chicago, May 31-June 1. Dr. Gordon D. Hoople, 713 E. Genesee St., Syracuse, N. Y., Secretary.

American Pediatric Society, Skytop, Pa., May 1-3. Dr. Hugh McCulloch, 325 N. Euclid Ave., St. Louis 8, Secretary.

American Psychiatric Association, Chicago, May 27-30. Dr. Winfred Overholser, St. Elizabeth's Hospital, Washington 20, D. C., Secretary.

American Society for Research in Psychosomatic Problems, New York, May 11-12. Dr. Edwin G. Zabriskie, 714 Madison Ave., New York 21, Secretary.

Arizona State Medical Association, Phoenix, May 2-3. Dr. Frank J. Milloy, 112 N. Central Ave., Phoenix, Secretary.

Arkansas Medical Society, Little Rock, April 14-15. Dr. W. R. Brooksher, 602 Garrison Ave., Fort Smith, Secretary.

Association of American Physicians, Atlantic City, May 28-29. Dr. Joseph T. Wearn, 2065 Adelbert Road, Cleveland 6, Secretary.

California Medical Association, Los Angeles, May 7-10. Dr. George H. Kress, 450 Sutter St., San Francisco 8, Secretary.

Central States Dermatological Society, Detroit, April 27. Dr. Clarence E. Reyner, Henry Ford Hospital, Detroit, Secretary.

Connecticut State Medical Society, Hartford, May 1-3. Dr. Creighton Barker, 258 Church St., New Haven 10, Secretary.

Florida Medical Association, Jacksonville, April 22-24. Dr. Robert B. McIver, P. O. Box 1018, Jacksonville, Secretary.

Georgia, Medical Association of, Macon, May 7-10. Dr. Edgar D. Shanks, 478 Peachtree St., N.E., Atlanta, Secretary.

Illinois State Medical Society, Chicago, May 14-16. Dr. Harold M. Camp, 224 S. Main St., Monmouth, Secretary.

Iowa State Medical Society, Des Moines, April 17-19. Dr. John C. Parsons, 406 Sixth Ave., Des Moines 9, Secretary.

Kansas Medical Society, Wichita, April 22-25. Dr. F. R. Croson, 112 W. Sixth St., Topeka, Secretary.

Louisiana State Medical Society, Alexandria, May 6-8. Dr. P. T. Talbot, 1430 Tulane Ave., New Orleans 13, Secretary.

Maryland, Medical and Chirurgical Faculty of, Baltimore, April 23-24. Dr. W. Houston Toulson, 1211 Cathedral St., Baltimore 29, Secretary.

Massachusetts Medical Society, Boston, May 21-23. Dr. Michael A. Tighe, 8 Fenway, Boston, Secretary.

Minnesota State Medical Association, St. Paul, May 20-22. Dr. B. B. Souster, Lowry Medical Arts Bldg., St. Paul 2, Secretary.

Mississippi State Medical Association, Jackson, May 14-15. Dr. T. M. Dye, Box 295, Clarksdale, Secretary.

Nebraska State Medical Association, Lincoln, May 6-9. Dr. R. B. Adams, 416 Federal Securities Bldg., Lincoln 8, Secretary.

New Hampshire Medical Society, Manchester, May 14. Dr. C. R. Metcalf, 5 S. State St., Concord, Secretary.

New Jersey, Medical Society of, Atlantic City, May 21-23. Dr. Alfred Stahl, 55 Lincoln Park, Newark, Secretary.

New York, Medical Society of the State of, New York, April 29-May 3. Dr. Walter P. Anderton, 292 Madison Ave., New York 17, Secretary.

North Carolina, Medical Society of the State of, Pinehurst, May 1-3. Dr. Roscoe D. McMillan, P. O. Box 232, Red Springs, Secretary.

North Dakota State Medical Association, Bismarck, May 26-28. Dr. L. W. Larson, 221 Fifth St., Bismarck, Secretary.

Ohio State Medical Association, Columbus, May 7-9. Mr. Charles S. Nelson, 79 E. State St., Columbus, Executive Secretary.

Rhode Island Medical Society, Providence, May 15-16. Dr. William P. Buffum, 122 Waterman St., Providence 6, Secretary.

Society of American Bacteriologists, Detroit, May 21-24. Dr. Leland W. Parr, 1335 H St., N. W., Washington 5, D. C., Secretary.

South Carolina Medical Association, Myrtle Beach, April 30-May 2. Dr. Julian P. Price, 105 W. Cheves St., Florence, Secretary.

South Dakota State Medical Association, Aberdeen, June 1-4. Dr. Roland G. Mayer, 22½ S. Main St., Aberdeen, Secretary.

Texas, State Medical Association of, Galveston, May 6-9. Dr. Holman Taylor, 1404 W. El Paso St., Fort Worth 3, Secretary.

West Virginia Medical Association, Huntington, May 13-15. Mr. Charles Lively, P. O. Box 1031, Charleston 24, Executive Secretary.

Medical News

(Physicians will confer a favor by sending for this department items of news of more or less general interest: such as relate to society activities, new hospitals, education and public health.)

CALIFORNIA

Fund for Cancer Research.—The Jewish Fund for Medical Research has given $40,000 to the University of California for cancer research on the Los Angeles campus, according to the university Clip Sheet. Part of the fund will be used for a special building on the Los Angeles campus and will be designed to facilitate expansion of a cancer research project already in progress and results of which are pronounced "encouraging" by Harry S. Penn, research associate in zoology, who is directing the work. The Jewish Fund for Cancer Research was incorporated June 28, 1943 under the laws of the District of Columbia. The trustees are Edmond I. Kaufmann, Cecil D. Kaufmann and Marcus S. Goldnamer, all of Washington, D. C. The work sponsored by the fund has been in progress by the university about two years.

FLORIDA

State Medical Meeting.—The seventy-second meeting of the Florida Medical Association will be held at the George Washington Hotel, Jacksonville, April 22-24, under the presidency of Dr. John R. Boling, Tampa. Among the speakers will be:

Dr. Frank K. Boland, Progress in Abdominal Surgery.
Dr. Wilson T. Sowder, Jacksonville, Public Health Problems in Florida.
Dr. William O. Fowler, Orlando, Pulmonary Resection in Nontuberculous Diseases of the Chest.
Dr. George D. K. Lilly, Miami, Peripheral Vascular Disease.
Dr. Vernon A. Lockwood, St. Augustine, Abdominal Incisions and Suture Materials.
Dr. Richard F. Stover, Miami, Significance of Soft Tissue Injuries.
Dr. Alfred M. Bidwell, Tampa, Treatment of Sacroiliac Sprain by Manipulation.
Dr. James L. Borland, Jacksonville, Principles Governing the Treatment of Amebic Infection in the Intestine.
Dr. Alvyn W. White, Pensacola, Infantile Scurvy.
Dr. James N. Patterson, Tampa, The Role of the Rh Factors in Clinical Medicine.

Other groups meeting include:

Florida section of the American College of Physicians.
Florida Railway Surgeons.
Florida Society of Ophthalmology and Otolaryngology.
Florida Association of Industrial Surgeons.
Florida Pathological Society.
Florida Pediatric Society.
Florida Health Officers' Society.
Florida Radiological Society.
Florida Society of Dermatology and Syphilology.

The nineteenth meeting of the Woman's Auxiliary of the Florida Medical Association will also be held.

ILLINOIS

New Health Officer of Peoria County.—Dr. Harry R. Marlatt, Peoria Heights, assistant city health officer, has been named health officer of the newly organized full time Peoria County health unit. A seven member board has been set up with Earl E. Downing, Elmwood, county superintendent of schools, as president.

Chicago

Cutter Memorial.—The Spring Quarterly Bulletin of Northwestern University Medical School has been designated the Irving S. Cutter number in honor of the former dean of the medical school, who died in 1945.

The Hamburger Lecture.—Dr. Samuel A. Levine, assistant professor of medicine, Harvard Medical School, Boston, will give the third Walter Wile Hamburger Memorial Lecture of the Institute of Medicine of Chicago, May 24, at the Palmer House. His subject will be "The Treatment of Congestive Heart Failure."

Service Club Pledges $150,000 to Hospital.—Mount Sinai Hospital Service Club, an organization which was associated with Mount Sinai Hospital for over twenty-five years, recently pledged $150,000 payable in yearly instalments of $15,000 to support research at Mount Sinai Hospital under the direction of Dr. Israel Davidsohn, director of laboratories and pathologist to the hospital.

Personal.—Dr. Frederick Steigmann, assistant professor of medicine, University of Illinois College of Medicine, who before entering the medical corps of the U. S. Naval Reserve was director of therapeutics at the Cook County Hospital and associate director of the Ludvig Hektoen Institute for Medical Research of Cook County in charge of clinical investigation, has returned from active service and resumed his former duties.

Brochure on Hektoen Institute.—A brochure on the Hektoen Institute for Medical Research of Cook County has recently been made available. It contains photographs of the institute at 629 South Wood Street and one of Dr. Ludvig Hektoen, for whom the institute is named. A complete review of the institute's history and proposed activities is also contained in the booklet as well as a biography of Dr. Hektoen.

Dr. Hollender Retires as Professor Emeritus.—Dr. Abraham R. Hollender, Miami Beach, Fla., who until recently was acting head of the department of otolaryngology, the University of Illinois College of Medicine, has been granted retirement by the university with the rank of professor of otolaryngology emeritus, effective February 1. Dr. Hollender has resumed practice in Miami Beach, Fla.

Physician Bequeaths $50,000 to Michael Reese Hospital.—The late Dr. Lester E. Frankenthal bequeathed $50,000 to Michael Reese Hospital, where he first became associated as intern in 1883, joining the staff six years later. His wife, Mrs. Ann E. Nourse Frankenthal, a graduate of St. Luke's Hospital, founded the Michael Reese Hospital School of Nursing in 1890 and was its first director. Dr. Frankenthal became senior attending physician in obstetrics and gynecology in 1924 and remained on the staff until his death. His son, Dr. Lester E. Frankenthal Jr., has been a member of the department of obstetrics and gynecology since 1927. Dr. Frankenthal died Dec. 19, 1945, aged 81.

INDIANA

Personal.—Dr. Schuyler F. Teaford, Paoli, has resigned as health officer of Orange County.——Dr. Newton W. Larkum, recently released from the Army Medical Corps, has been appointed medical director of the Ames Company, Inc.——Dr. Edwin R. Smith, Indianapolis, has been appointed a member of the Indiana council for mental health, filling a vacancy that occurred with the death of Dr. Larue D. Carter.——Dr. Walter Stoeffler, Indianapolis, has been named pediatric consultant in the division of maternal and child health, Indiana State Board of Health.

State Geriatrics Institute.——A one day geriatrics institute sponsored by the Indiana University School of Medicine, Indianapolis, and the Indiana State Board of Health will be held in the auditorium of the university May 22. The purpose of the institute is to study the process of aging, the problems of the aged and the more common diseases and disabilities associated with aging. In attendance will be physicians interested in geriatrics, educators, dentists, nurses, social workers, representatives of industry and labor and, in fact, all who may have an interest in the medical, social and economic problems connected with the rapidly increasing age of our population. The forenoon session of the institute will be devoted to a discussion of health guidance in maturity, mental hygiene and geriatrics, with a symposium on diseases of advancing years, including cardiovascular renal diseases, arthritis, cancer, eye and ear diseases and endocrine therapy with Dr. Willis D. Gatch, dean of the university, presiding. With Dr. Leroy E. Burney, state health commissioner, presiding, the afternoon program will be devoted to an address on geriatric medicine by Dr. Edward J. Stieglitz, Washington, D. C., consultant in gerontology to the National Institute of Health. As an additional feature, aging as an industrial health problem will be discussed by a representative of labor, a representative of management and an industrial physician. A public meeting will be held in the evening. All the facilities of the Indiana University School of Medicine and of the state board of health will be devoted to making this institute a success and in creating a widespread interest, both professional and public, in the purpose of the institute. A division of adult hygiene and geriatrics was recently created in the state department of health with Dr. William F. King, Indianapolis, as director (The Journal, February 9, p. 361).

LOUISIANA

Student Awards for Published Articles.—Beginning with volume 8, the *Journal of the Louisiana State University School of Medicine* will offer to the student body two awards of $25 each for articles submitted for publication. Volume 8 of the journal will begin with the March issue.

MARYLAND

State Medical Meeting.—The Medical and Chirurgical Faculty of Maryland will hold its meeting at the Belvedere Hotel, Baltimore, April 23-24, under the presidency of Dr. Thomas R. Chambers, Baltimore, who will discuss "Postwar Asthenia." Among the speakers will be:

Dr. Nicholson J. Eastman, Baltimore, Median versus Lateral Episiotomy.
Drs. John Mason Hundley Jr. and Beverly C. Compton, both of Baltimore, Carcinoma of the Cervix.
Dr. John A. C. Colston, Baltimore, Carcinoma of the Prostate: Endocrine Therapy and the Radical Operation.
Dr. Charles Lagley Jr., Baltimore, The Story of Cerebral Injuries.
Dr. Alan C. Woods, Baltimore, Early Treatment of Eye Injuries.
Dr. William J. Fulton, Detroit, Doctor in Industry.
Dr. Wallace M. Yater, Washington, D. C., Coronary Artery Disease in Young Men—A Study of 400 Cases Proved at Necropsy.
Dr. John T. King, Baltimore, Acute Cardiac Disorder Simulated by Pulmonary Embolism.
Dr. Alfred Blalock, Baltimore, The Surgical Treatment of Pulmonary Stenosis.
Dr. Arthur W. Allen, Boston, Venous Thrombosis and Pulmonary Embolism: A Comparative Study of Femoral Vein Interruption and Dicumarol Therapy.
Dr. Harry M. Robinson Jr., Baltimore, Common Dermatologic Problems Presented by the Veteran.
Dr. Henry M. Fox, Boston, Brief Psychotherapy Overseas and at Home.
Dr. Maurice C. Pincoffs, Baltimore, Medical Problems in the Southwest Pacific Area.
Dr. Harvey B. Stone, Baltimore, The Handling of Large Hemorrhages into the Bowel.
Dr. George H. Yeager, Baltimore, Noninfective Gangrene Following Fracture of Lower Leg.
Dr. Perrin H. Long, Baltimore, The Etiology and Epidemiology of Infectious Hepatitis.
Dr. Harry C. Hull, Baltimore, Visualization of Amebic Abscesses of the Liver as an Aid to Therapy and Prognosis.
Dr. Joseph E. Moore, Baltimore, Penicillin in the Treatment of Syphilis.
Dr. Theodore E. Woodward, Baltimore, Chemotherapy in the Rickettsial Diseases, with Special Reference to Para-Aminobenzoic Acid.

On Wednesday evening at a public meeting Dr. Warfield T. Longcope, who is retiring as professor of medicine, Johns Hopkins University School of Medicine, Baltimore (The Journal, January 26, p. 231), will deliver the Trimble Lecture on "The Treatment of Metallic Poisoning by BAL (British Antilewisite)." A meeting will also be held Wednesday to honor Marcia C. Noyes, who has been librarian for the faculty for fifty years and executive secretary of the state association for twenty years. Miss Noyes was employed by the late Bernard C. Steiner, then librarian at Pratt Library, who in 1896 recommended her services to Dr. William Osler, who had just succeeded in having moved from the basement of the Athenaeum the library of the Medical and Chirurgical Faculty. The program of the faculty also includes round table discussions.

MICHIGAN

Cancer Day.—On March 20 the Genesee County Medical Society inaugurated an annual Cancer Day in Flint. Among the speakers were:

Dr. Paul A. O'Leary, Rochester, Minn., Cutaneous Malignancy.
Dr. Louis E. Phaneuf, Boston, Cancer of the Uterus.
Dr. Frederick A. Coller, Ann Arbor, Cancer of the Stomach.
Dr. Charles B. Huggins, Chicago, Cancer of the Genitourinary Tract.
Dr. Frank E. Adair, New York, Cancer of the Breast.
Mr. Elmer H. Bobst, New York, The Cancer Problem in America.

Udo Wile Honored.—Dr. Udo J. Wile, professor of preventive medicine and public health, University of Michigan Medical School, Ann Arbor, was recently made a "Commander of the Order of Public Health," a decoration which had previously been issued to two other persons, one of whom is Sir Alexander Fleming. The decoration was awarded to Dr. Wile by the French minister of health for his service while in France in instituting a venereal disease program. Dr. Wile recently returned from France.

Course for Practitioners.—Dr. Frederick A. Coller, professor of surgery, and the chiefs of the various divisions at the University Hospital, University of Michigan Medical School, Ann Arbor, will offer a course for returning medical veterans who are general practitioners. Subject material to be presented in clinics, lectures, demonstrations and ward rounds will include minor surgery in office practice, nonoperative gynecology and obstetrics, otolaryngology and ophthalmology, dermatologic lesions, burns, general medical practice, infectious diseases, treatment of venereal diseases, pediatric practice, neurology and psychiatry. The teaching schedule may be obtained on request. The course will begin April 29 and end June 22.

Koch Dismissal Denied by Court.—Federal Judge Robert R. Nevin on March 11 overruled a defense motion to dismiss charges of mislabeling and misbranding purported cancer cures, for which Dr. William F. Koch, Detroit, and his brother Louis and the Koch Laboratories are on trial. Judge Nevin also ruled against a motion to strike out all testimony pertaining to malonic and glyoxylic acids, both of which concoctions, the prosecution claims, duplicate the Koch products malonide and glyoxylide. The motion to drop the charges was filed February 19, but the court had deferred ruling until sufficient evidence had been heard to support government claims, according to the Detroit *Times*.

Curative Workshop.—The Curative Workshop with quarters at 65 Ferry Avenue, West Detroit, was recently incorporated as an independent organization. The workshop has been approved by the Wayne County Medical Society, which has also named the medical advisory committee, including Drs. Wyman D. Barrett, chairman; Leo H. Bartemeier, Arbie L. Brooks, Ralph E. Hall, Clyde N. Hasley, James W. Lasley, John J. Prendergast Jr., Frank H. Purcell, Robert J. Schneck and Francis Walsh, all of Detroit, and Earle A. Irvin, Grosse Pointe. The present workshop is an outgrowth of the program started in 1934 by the Visiting Nurses Association. The present activity was evolved in March 1945, when representatives of the board of the Visiting Nurses Association and the Detroit Orthopaedic Clinic consulted with the Wayne County Medical Society. Miss Helen King is technical director of the Curative Workshop.

MINNESOTA

New County Bulletin.—The St. Louis County Medical Society is now publishing its own bulletin. In the four issues thus far published are contained announcements and news of returning members. Officers of the society are Drs. Daniel W. Wheeler, Duluth, president-elect; Paul G. Boman, Duluth, president; Francis W. Bachnik, Hibbing, vice president; Elizabeth C. Bagley, Duluth, secretary-treasurer, and Mrs. Margaret B. Gilbert, executive secretary.

NEW YORK

Alpha Omega Alpha Lectures.—Dr. Robert H. Williams, instructor in medicine, Harvard Medical School, Boston, gave the spring lecture of Alpha Omega Alpha at Syracuse University College of Medicine on March 7. His lecture was on "Recent Studies of the Physiology and Treatment of Thyrotoxicosis."——Dr. Carl A. L. Binger, New York, gave the annual address of the Alpha Omega Alpha Society, University of Rochester School of Medicine and Dentistry, March 15, on "The Doctor's Dilemma."

Training for Psychiatrists.—On March 23 the New York State Department of Mental Hygiene announced the establishment of a program to train physicians in psychiatry and neurology to meet the unprecedented need for increased medical personnel for hospital and outpatient treatment of persons suffering from mental and nervous diseases. Provision has accordingly been made for the training of a hundred physicians through courses which were to begin on April 5. These doctors will be added to the staffs of all the department's mental hospitals and the state schools for the mentally deficient, where they will serve as resident physicians while in training. The program will be inaugurated with courses set up at the New York State Psychiatric Institute and Hospital in New York City in conjunction with the Columbia University College of Physicians and Surgeons and at the Syracuse Psychopathic Hospital in conjunction with Syracuse University College of Medicine. The courses, starting April 5 in New York and May 3 in Syracuse, will continue weekly for forty-eight weeks. They will consist of lectures, clinical conferences and laboratory work and will meet the primary requirements of the American Board of Psychiatry and Neurology. Formal instruction will be supplemented by supervised clinical work at the resident's institution. Dr. Frederick MacCurdy, state commissioner of mental hygiene, in announcing the program, stated that in normal times there were some 3,500 trained psychiatrists in the United States and that it has been conservatively estimated that at least three times as many could be used to advantage at the present time.

New York City

Special Lectures.—Dr. Ernest Laqueur, Institute of Pharmacotherapy, Amsterdam, will deliver the seventh Harvey Society Lecture of the current series at the New York Academy of Medicine, April 18. Dr. Laqueur will speak on "Interrelationships Between Gonadotropic and Sex Hormones."——Dr. Isidor Snapper will discuss "Bone Diseases" before the New York Institute of Clinical Oral Pathology, April 29, at the New York Academy of Medicine.

History of Medicine in Art.—An exhibition of the history of medicine in art will open April 15 at New York University College of Medicine. The prints are from a collection of more than 1,000 owned by Dr. Clements C. Fry of the department of health, Yale University School of Medicine, New Haven, who has been collecting medical prints since 1927. Many of his earliest examples were acquired from the collection of Dr. Eugen Hollander, who wrote extensively on the history of medical caricature. The exhibition will include prints displayed recently at the National Gallery of Art, Washington, D. C., and others selected by Dr. Fry from his collection especially from New York University's showing. The exhibit will close April 27. Several early fifteenth century woodcuts representing cures by faith and works of Lucas van Leyden, Pierre van der Borcht, van Ostade and Rembrandt in the sixteenth and seventeenth centuries will be shown. Emphasis falls on the eighteenth century, when charlatans and quacks were popular targets for satire. Examples include caricatures by Rowlandson and Woodward and an unusual colored aquatint by L'Eveille. Prints by Daumier, Boilly and Cruikshank are among those on medical subjects in nineteenth century art. Among the examples of contemporary art are two drawings by Darrow and Petty satirizing interest in psychoanalysis.

OHIO

Dr. Hudson Named Dean of State Graduate School.—Dr. N. Paul Hudson, professor and chairman of the department of bacteriology, Ohio State University College of Medicine, Columbus, and the university graduate school, has been named dean of the graduate school to succeed Alpheus W. Smith, Ph.D., who will retire August 31. Dr. Hudson, who graduated at Harvard Medical School, Boston, in 1925, has served at different times as instructor at the University of Chicago, assistant pathologist, Boston City Hospital, field director in yellow fever with the International Health Division, Rockefeller Foundation, West Africa, and professor of bacteriology and hygiene at the University of Chicago. He has been associated with the Ohio State University since 1935.

Changes in Biochemistry at Western Reserve.—Harland G. Wood, Ph.D., associate professor of physiologic chemistry, University of Minnesota, Minneapolis, will head the department of biochemistry, Western Reserve University, Cleveland, which has received a $500,000 gift to expand its work. Dr. Wood, who will occupy his new position on July 1, has done notable research in physiologic bacteriology, the biochemistry of bacteria and more recently with isotopes in the study of the roles various chemical elements play in metabolism of nerve tissue in infantile paralysis. He will succeed Victor C. Myers, Ph.D., who has been named head of the newly created department of clinical biochemistry at the school of medicine. The gift of $500,000 from the Elisabeth Severance Prentiss Foundation has made it possible to bring in Dr. Wood and with him leadership in the newer fields of biochemistry. Dr. Wood's staff of assistants and associates will be announced later, but it will be adequate to enable the school of medicine to carry on large scale work in the chemistry of living processes. Dr. Wood, who won the annual Eli Lilly Award for his work in biochemistry of bacteria in 1942 (THE JOURNAL, Feb. 13, 1943, p. 531), graduated at Macalester College, St. Paul, in 1931.

OREGON

Executive Secretary for Multnomah County.—Mr. Richard K. Stanton, Spokane, Wash., on terminal leave with the rank of lieutenant from the U. S. Naval Reserve after four years' service, has been appointed executive secretary of the Multnomah County Medical Society, effective May 1. This is a newly created position. Mr. Stanton, who graduated at the University of Idaho in 1934 and who has an M.A. degree from Stanford University, has had varied experience in newspaper work, public relations and advertising agencies. His address will be the University Club, Portland.

VIRGINIA

Hospital News.—Raiford Hospital, Franklin, was recently opened with a capacity of 80 beds. The hospital is named for Dr. Rufus L. Raiford, Franklin, who founded its "predecessor institution some years ago."

Physician Honored.—The Chatham Lions Club recently selected Dr. Oscar L. Ramsey, Gretna, as the most valuable citizen of 1945 of Pittsylvania County. The citation designating Dr. Ramsey stated that he had given unsparingly of his time "in doing for others."

Chiropractors and Naturopaths Not Exempted from State Examinations.—At the present session of the general assembly the chiropractors and naturopaths presented a bill requesting an amendment to the healing arts act of 1944 to write in a "grandfather" clause permitting all chiropractors and naturopaths practicing in Virginia at that time permanent exemption from examinations by the state board of medical examiners, according to the *Virginia Medical Monthly*. This came up on the floor of the senate and, after discussion, was voted down by a vote of 22 to 15. In 1944 they had been given five years in which to comply with the law.

GENERAL

Radiologic Conference.—The midsummer radiologic conference of the Rocky Mountain Radiological Society will be held August 8-10 at the Shirley Savoy Hotel, Denver. Dr. Leonard G. Crosby, Denver, is president and Dr. Alfred M. Popma, Boise, Idaho, secretary-treasurer.

Cancer Campaign.—With April designated by an act of Congress as Cancer Control Month, the American Cancer Society launched its campaign on April 1 to obtain $12,000,000. A dinner in New York officially opened the program. A feature of the campaign will be the collections in motion picture theaters throughout the country during the week of April 21 and continuing for eight consecutive days. A trailer made in Hollywood features Spencer Tracy in a stirring appeal for funds to fight against cancer.

Special Society Elections.—Dr. Stuart Mudd, Philadelphia, was recently elected president of the American-Soviet Medical Society, filling the vacancy that occurred when Dr. Walter B. Cannon died. Dr. Abraham Stone, New York, is the corresponding secretary.——Dr. John S. LaDue, New York, has been elected chairman of the eastern section and Dr. Robert H. Bayley, Oklahoma City, of the southern section of the American Federation for Clinical Research. Dr. Richard H. Lyons, University Hospital, Ann Arbor, Mich., is secretary-treasurer of the American Federation for Clinical Research, which will hold its meeting in Atlantic City, May 28.

Medical Directors of Red Cross.—Dr. Asa Barnes has been transferred from the national headquarters of the American National Red Cross, Washington, D. C., to San Francisco as medical director in charge of the Pacific area office. Dr. Courtney M. Smith is acting medical director in the Washington headquarters. Other area medical directors include:

Dr. Harry E. Kleinschmidt, North Atlantic Area Office, 300 Fourth Avenue, New York 10.

Dr. Ollie M. Goodloe, Eastern Area Office, 615 North St. Asaph Street, Alexandria, Va.

Dr. John M. Walton, Southeastern Area, Office, 230 Spring Street N.W., Atlanta 3, Ga.

Dr. Raymond F Barnes, Midwestern Area Office, 1709 Washington Avenue, St. Louis 3.

Marquard Finds Gebhard with Aid of The Journal.—On March 22 Dr. Bruno Gebhard, director of the Cleveland Health Museum, received a letter from Dr. Kurt Marquard, medical officer in the German army. The two physicians had been close friends at one time but had lost track of each other. Dr. Marquard, who had been captured in the allied drive, was assigned to inspection of sanitary conditions in a prison camp in France. While on tour he noticed a copy of THE JOURNAL for March 3, 1945 in some discarded papers. In it he found an article on "Community Health Education by the Medical Profession" by his friend Dr. Gebhard, to whom he immediately wrote, reestablishing relations that had been terminated when Dr. Gebhard came to this country in 1937.

Dean of Beirut University Visits United States.—James O. Pinkston, Ph D., dean of the medical division of the American University of Beirut, Lebanon, recently arrived in the United States to help raise funds for the $2,500,000 expansion program of the medical division and to recruit faculty members. The American University of Beirut, one of the eight colleges affiliated in the Near East College Association, was founded in 1866 with a charter from the state of New York. Its medical school, which opened a year later, has given a four year course of training to more than a thousand doctors and has also graduated hundreds of nurses. The university is said to be the largest American educational institution outside the United States. It offers education to men and women without regard to religion, race, nationality or color. Most graduates of the medical school practice in Lebanon, Syria, Palestine, Trans-Jordan and Iraq. Students come to the school from these countries as well as from Sudan, Iran, India, East Africa, Greece, Albania, Egypt and the United States. The proposed project was described in THE JOURNAL Dec. 29, 1945, page 1279.

LATIN AMERICA

Health Activities in Latin America.—*Hospital News.*—A new 108 bed tuberculosis hospital is scheduled to be ready for occupancy in October in Tegucigalpa, Honduras. It is being constructed jointly by the government of Honduras and the Institute of Inter-American Affairs, Washington, D. C.

Peruvian Health News.—The president of Peru recently appointed a seven man commission to draft plans for reorganizing the National Department of Health. Among the major changes already recommended are decentralization of all health functions by the establishment of departments (corresponding to the states in the United States) and district health departments, establishment of requirements that all public health officials be trained in public health before appointment and establishment of full time work for all public health officials. Dr. Ernest B. Howard, Boston, has been named chief of the field party in Peru, succeeding Dr. Edward A. Westphal, who has returned to Glendale, Calif., to engage in private practice. The health program in Peru was originally established for the two year period July 1942 to July 1944. In March 1944 the United States and the republic of Peru entered into an agreement to extend the program for another three years, that is from July 1944 to July 1947. To finance this program the Institute of Inter-American Affairs is contributing $1,850,000 and the government of Peru $672,388. The government of Peru is also contributing facilities, equipment and material. Among the projects undertaken were the establishment of seven hospitals, four dispensaries, four health centers, twenty-seven medical posts and one mobile dispensary. Except for one dispensary the provision of each of these health facilities involved the construction of a building or the extensive remodeling of one in existence.

New Publication on Tropical Medicine.—*Revista Kuba* recently made its appearance in Havana, Cuba. It will be devoted to parasitology and tropical diseases and will be published monthly under the direction of Drs. Pedro Kouri Esmeja and Jose G. Basnuevo Artiles, professors of parasitology and tropical medicine at the University of Havana. The address is Revista Kuba, Apartado #899, Havana, Cuba.

Pan American Congress of Ophthalmology.—At the business meeting of the second Pan American Congress of Ophthalmology in Montevideo, Uruguay, Nov. 26-Dec. 1, 1945 it was decided to establish a committee on education to survey conditions of the teaching of ophthalmology in several study centers in Latin America, establishing an exchange of professors, assistants and pupils, establish correspondence courses and establish boards similar to that of the American Board of Ophthalmology or of courses for the information of ophthalmologists in the medical schools. It was agreed that a committee would be named to carry out the measures proposed by the committee in education. The boards that would be formed would be charged with organizing sectional meetings in the years when no Pan American Congress was scheduled. The program includes the hope that there will be established a "central exchange" through which ophthalmologists throughout the continent may obtain complete bibliographic information. The committee on education includes Dr. Jorge Valdeavellano (Arequipa 149, Lima, Peru), president; Dr. Thomas D. Allen, Chicago, representing North America (Canada and the United States); Dr. Miguel A. Branly, Havana, representing Central America (Mexico, Panama, Nicaragua, Guatemala, Honduras, Costa Rica, Cuba, Haiti, San Salvador, Dominican Republic, Venezuela and Columbia), and Dr. Rodriguez Barrios, Montevideo, Uruguay, representing South America (Ecuador, Peru, Paraguay, Uruguay, Bolivia, Chile, Argentina and Brazil).

Society News.—New officers of the "Colegio Medico de El Salvador" include Dr. Carlos Gonzalez B., president; Dr. Esteban Reyes, vice president; Dr. Gregorio Avila Agacio, secretary; Dr. Margaret de Beneke, undersecretary, and Dr. Alfredo Sanchez-Mairena, treasurer.

Changes in Personnel in Health and Sanitation Division.—Dr. Walter M. Smith, formerly of Little Rock, Ark., Major, M. C., Army of the United States, associate chief of party, Mission Sanitaire Americaine in Haiti, has become director of the Yaws program in Haiti, succeeding Dr. James H. Dwinelle, who plans to return to private practice in Rye, N. Y.——Dr. Frank R. Neff, recently released from the Army of the United States with the rank of lieutenant colonel, joined the staff of the Institute of Inter-American Affairs in January and has been assigned as associate chief of field party for Costa Rica. Dr. Erwin F. Hoffman, formerly of Jacksonville, Fla., has been named chief of party in Nicaragua to succeed Dr. Leonard S. Rosenfeld, formerly of Brooklyn.

Government Services

New Library Chief

Max H. Fisch, formerly curator of the rare book collection, Cleveland Branch of the Army Medical Library, has been made chief of the branch which is known as the history of medicine division.

Annual Reports of Government Agencies

Annual reports of various governmental services have recently been made available, including those for the U. S. Public Health Service, Veterans Administration, Food and Drug Administration and Federal Security Agency, for the fiscal year ending June 1945. The annual report of the Gorgas Memorial Laboratory for the fiscal year of 1944 has also been published.

Liaison Officer Named

Surgeon Norvin C. Kiefer, Geneva, Ohio, has been appointed to serve in the office of the chief, Tuberculosis Control Division, U. S. Public Health Service, as vocational rehabilitation liaison officer with the vocation rehabilitation division of the U. S. Office of Education. Dr. Kiefer graduated at the University of Michigan Medical School, Ann Arbor, in 1930.

Colonel Dart Goes to Institute of Pathology

Col. Raymond O. Dart, deputy chief surgeon for the Army Forces in the Western Pacific, has been appointed assistant director of administration at the Army Institute of Pathology. Colonel Dart has been awarded the Legion of Merit and the Bronze Star for his services since going to the Pacific in 1942 as commanding officer of the 105th General Hospital, an affiliated unit of Harvard University. Dr. Dart graduated at Rush Medical College in 1916.

Research on the Common Cold

A prolonged study of the common cold will start about July 1 at the National Institute of Health, U. S. Public Health Service, Bethesda, Md. About $50,000 has been earmarked to begin the project, which will continue until the prevention and the cure of the common cold are determined. A common cold unit will be set up in the division of infectious diseases. Dr. Rolla E. Dyer is director of the National Institute of Health.

Fellowships for Health Education

Fellowships for a year of graduate study in health education at one of the leading schools of public health are being offered by the U. S. Public Health Service through funds made available by the National Foundation for Infantile Paralysis, according to Surg. Gen. Thomas Parran, U. S. Public Health Service, Federal Security Agency, Washington. Tuition, travel expenses for field experience and a stipend of $100 a month are provided. The training, which leads to a master's degree in public health from an accredited school of public health, starts with the fall quarter of 1946. Men and women between the ages of 22 and 40 who are citizens of the United States and who can meet the entrance requirements of the school of public health of their choice are eligible to make application. Candidates must hold a bachelor's degree from a recognized college or university and must have had some work experience in a related field. Previous training in the biologic or physical sciences, sociology and education is usually required. Veterans are encouraged to apply for fellowships. Subsistence allowance under the G. I. Bill of Rights will be supplemented by fellowship funds to provide a total stipend of $100 a month. Training consists in nine months of academic study in public health, health education, community organization and information technics and three months of supervised field experience in community health education. Persons accepting fellowships are expected to work in the field of health education for at least two years after the training period. Schools of public health are located at Columbia University, Harvard University, Johns Hopkins University, the University of California, the University of Michigan, the University of Minnesota, the University of North Carolina and Yale University. Application forms may be obtained from the Surgeon General, U. S. Public Health Service, Washington 25, D. C. Completed applications must be filed by June 1 for consideration.

Deaths

John Shelton Horsley ⊕ a leader in the advancement of surgery, died at his home in Richmond, Va., April 7, aged 75.

Dr. Horsley was born in Lovingston, Va., Nov. 24, 1870. After graduation at the University of Virginia Department of Medicine, Charlottesville, in 1892 he took postgraduate work in New York and started the practice of medicine in Nelson County, Va. He moved to Staunton in 1894 but in 1896 he returned to New York. From 1899 to 1903 he practiced in El Paso, Texas, acting as proprietor and surgeon in chief of St. Luke's Hospital. Then he went to the Medical College of Virginia, Richmond, and served as professor of the principles of surgery until 1912.

Dr. Horsley was a fellow of numerous scientific groups, including the American and Southern surgical associations. He served the American Medical Association as a member of the House of Delegates from 1908 to 1910 and 1913 to 1914, chairman of the Section on Surgery, General and Abdominal, member of the Council on Scientific Assembly from 1915, when it was created, to 1930, holding the chairmanship from 1919 to 1930. He had been a member of the founders group of the American Board of Surgery. He had once been president of the Richmond Academy of Medicine, Medical Society of Virginia, Southern Medical Association, the Virginia Academy of Science and the American Association for the Study of Neoplastic Diseases. He was an honorary member of the St. Louis Medical Society, a member of the Virginia State Hospital Board, a former vice president of the Tri-State Medical Association of the Carolinas and Virginia and a corresponding fellow of the Medical Society of London.

As a past president of the Virginia Cancer Foundation and a member of the National Advisory Cancer Council he was arduous in his support of educational activities against cancer. He had received numerous honors for his work as a surgeon, including the gold medal of the Southern Medical Association for his work on the surgery of blood vessels and intestine and, at five different times, certificates from the American Medical Association for similar work. Honorary degrees were awarded to him, and in 1936 his portrait was unveiled during special ceremonies of the Ex-Interns Association of St. Elizabeth's Hospital, where he had been surgeon-in-chief for many years. He in turn had set up a memorial to his father in the department of medicine at the University of Virginia for research on general surgery and was instrumental in the establishment of prizes for papers by staff members of the Virginia state hospitals

JOHN SHELTON HORSLEY, 1870-1946

Throughout his life Dr. Horsley contributed extensively to the medical literature; he served as associate editor of Lewis's Practice of Surgery and was the author of Surgery of Blood Vessels, Operative Surgery, Surgery of Stomach and Small Intestine, Research and Medical Progress, and Surgery of Stomach and Duodenum.

Luther Leonidas Hill ⊕ distinguished surgeon and father of Senator Lister Hill, died at his home in Montgomery, Ala., April 4, aged 84

Dr. Hill was born in Montgomery Jan. 22, 1862. His early education was received at the school of Professor George Thomas, Montgomery, and at Howard College, then at Marion. He graduated at the University of the City of New York Medical Department in 1881 and at the Jefferson Medical College of Philadelphia in 1882. His numerous postgraduate studies included work with Lord Lister at the King's College Hospital, London.

Dr. Hill started the active practice of medicine in Montgomery in 1884. He became county physician in 1893 and was visiting surgeon of Laura Hill Hospital from 1897 to 1932. He had also been visiting surgeon of St. Margaret's Hospital and surgeon of the Mobile and Ohio Railroad, surgeon general of the Alabama National Guard and surgeon of the Second Alabama Regiment. Dr. Hill was president of the Montgomery Board of Health in 1893 and president of the United States Board of Pension Examiners in 1897.

In 1932 he was given a banquet by the Montgomery County Medical Society and presented with a silver cup to mark his completion of fifty years in the practice of medicine. In 1939 he was awarded a citation by the Medical Association of the State of Alabama for first successfully suturing a heart wound in the United States in 1902, a surgical accomplishment on which he made many successful improvements in subsequent years.

He was a fellow of the American College of Surgeons and a past president and life councilor of the Medical Association of the State of Alabama. He was also a past president of the Montgomery Medical and Surgical Society.

William Gilliam Kennon ⊕ Nashville, Tenn.; University of Pennsylvania Department of Medicine, Philadelphia, 1908; born in Sublets, Va., Oct. 25, 1883; professor of clinical otolaryngology at the Vanderbilt University School of Medicine; specialist certified by the American Board of Ophthalmology and the American Board of Otolaryngology; member and formerly vice president of the American Laryngological, Rhinological and Otological Society; member of the American Academy of Ophthalmology and Otolaryngology; past president of the Nashville Academy of Medicine; served in France during World War I; on the staffs of the Nashville General, Protestant, St. Thomas and Vanderbilt University hospitals; died January 3, aged 62, of coronary thrombosis.

Lloyd Bryan ⊕ San Francisco; University of California Medical Department, San Francisco, 1911; born in Fortuna, Calif., in 1884; associate clinical professor of radiology at his alma mater; specialist certified by the American Board of Radiology, Inc.; member of the American Roentgen Ray Society, American College of Radiology and the National Gastroenterological Society; member and past president of the Radiological Society of North America, Inc.; visiting roentgenologist at the Dante Hospital, Mount Zion Hospital, San Francisco Hospital and the Franklin Hospital, where he died December 21, aged 61, of lymphosarcoma

Frederick Whiting ⊕ New York; Long Island College Hospital, Brooklyn, 1885; born in Brooklyn, Feb 4, 1861; professor of clinical surgery (otology) emeritus at the Cornell University Medical College; consulting surgeon at New York Eye and Ear Infirmary and Mount Sinai Hospital, member of the American Otological Society; fellow of the American College of Surgeons and the New York Academy of Medicine; honorary member of the New York Otological Society; author of "Modern Mastoid Operation"; died March 12, aged 85, of cerebral hemorrhage.

Hans Edward Bedley, Meridean, Wis.; Barnes Medical College, St. Louis, 1908; died December 5, aged 83, of carcinoma of the stomach

John Nelson Blood ⊕ Redwood City, Calif.; College of Physicians and Surgeons of San Francisco, 1914; served during World War I and later in Siberia for a year with occupation forces; on the staffs of the Community Hospital of San Mateo County and the Mills Memorial Hospital in San Mateo, where he died December 25, aged 57, of cerebral hemorrhage.

Gregorio Catalano, Ransom, Pa.; Regia Università di Napoli Facoltà di Medicina e Chirurgia, Italy, 1905; member of the American Medical Association; medical director of the Ransom Mental Hospital; died in the West Side Hospital, Scranton, December 20, aged 67, of pneumonia.

William Clyde Comee ⊕ Green Bay, Wis.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1908; member of the American Academy of Ophthalmology and Otolaryngology; specialist certified by the American Board of Otolaryngology; died in the Bellin Memorial Hospital, December 8, aged 59, of influenza and lateral sclerosis.

George William Dahnke ⊕ Memphis, Tenn.; University of Tennessee College of Medicine, Memphis, 1925; instructor of dermatology and syphilology at his alma mater; died November 11, aged 48, of coronary occlusion.

Newcomb Lincoln Damon, New York; Boston University School of Medicine, 1883; died December 1, of arteriosclerotic heart disease.

Jacob A. Drooz, Albany, N. Y.; Albany Medical College, 1913; died December 13, aged 55, of cerebral thrombosis.

Clarence Payne Franklin ⊕ Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1893; fellow of the American College of Surgeons; for his services during World War I was decorated with the Italian War Cross and Order of the Crown of Italy; colonel, medical reserve corps, U. S. Army, not on active duty; died in the U. S. Naval Hospital December 11, aged 75.

George S. Gochenour, Moorefield, W. Va.; Baltimore Medical College, 1889; member of the American Medical Association; honorary life member of the West Virginia State Medical Association; past president of the Potomac Valley Medical Society; served as a member of the council, city health officer and vice president of the Hardy County Bank; died December 17, aged 88, of senility.

Charles W. Gooden, Edison, Neb.; Medical College of Indiana, Indianapolis, 1896; died December 22, aged 74, of burns received when his home caught fire.

George R. Gould, Warwick, N. Y.; Columbia University College of Physicians and Surgeons, New York, 1928; member of the American Medical Association; on the staff of St. Anthony's Hospital, where he died December 14, aged 41, of pulmonary embolism following laparotomy for ruptured gastric ulcer.

Charles Albert Jenkins, Keokuk, Iowa; Missouri Medical College, St. Louis, 1893; died December 5, aged 79, of cerebral hemorrhage.

Julian Lee Kendall, Mount Vernon, N. Y.; Manitoba Medical College, Winnipeg, Man., 1906; died December 19, aged 65, of coronary thrombosis.

David Hughes Lake, Syracuse, N. Y.; Jefferson Medical College of Philadelphia, 1885; member of the American Medical Association and affiliate member of the Medical Society of the State of Pennsylvania; past president of the Kingston (Pa.) Board of Health; died December 6, aged 81, of cancer of the stomach.

Charles E. Lauder, Viroqua, Wis.; University of Maryland School of Medicine, Baltimore, 1891; at one time secretary of the Vernon County Medical Society; a captain in the medical corps of the U. S. Army during World War I; for many years city health officer; died in Rochester, Minn., December 6, aged 79, of general peritonitis and ulcerative colitis.

Henry W. F. Law ⊕ Grand Forks, N. D.; Detroit College of Medicine, 1904; fellow of the American College of Surgeons; associated with the Grand Forks Clinic and was chief of staff of the Deaconess Hospital; died December 2, aged 74.

David Lorenzo Martin, Boston; Boston University School of Medicine, 1909; died December 6, aged 71, of cerebral hemorrhage.

George W. Mauzey, Findlay, Ill.; Louisville Medical College, 1892; Hospital College of Medicine, Louisville, Ky., 1893; a member of the "Fifty Year Club"; died January 2, aged 83, of an upper respiratory infection.

Melbourne George Millman, Alma, Mich.; Trinity Medical College, Toronto, Ont., Canada, 1888; died in the Michigan Masonic Home and Hospital January 5, aged 82, of carcinoma of the stomach.

Joseph Edward Norris ⊕ Baltimore; University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1917; served during World War I; physician for the Baltimore and Ohio Railroad; on the staffs of the University Hospital and the Bon Secours Hospital, where he died December 7, aged 51, of injuries to the chest received in an automobile accident.

Adrian W. Rhodes, New York; Université de Lausanne Faculté de médecine, Switzerland, 1941; interned at the Metropolitan Hospital and the Bellevue Hospital, New York, serving a fellowship in pediatrics at the latter; resident in pediatrics at the Flower and Fifth Avenue Hospitals, New York; died December 8, aged 29, of chronic nephritis.

William Henry Sage, Chicago; Loyola University School of Medicine, Chicago, 1942; interned at St. Bernard's Hospital, where he served a residency; died December 10, aged 33, of chronic myocarditis and bronchial asthma.

Charles Reuben Scott ⊕ Twin Falls, Idaho; Northwestern University Medical School, Chicago, 1900; born in Belvidere, Ill., March 2, 1878; fellow of the American College of Surgeons; member of the House of Delegates of the American Medical Association in 1917, 1918, 1933 and 1937; past president of the Southside Medical Society and the Idaho State Medical Society; past chief of staff, Twin Falls County General Hospital; died January 8, aged 67, of hypertensive cardiovascular disease.

William David Sellers, Birmingham, Ala.; Atlanta College of Physicians and Surgeons, 1902; member of the American Medical Association; died in the South Highland Infirmary December 17, aged 65, of coronary occlusion and general arteriosclerosis.

Lawrence Shields ⊕ Xenia, Ohio; Medical College of Ohio, Cincinnati, 1895; at one time director of the American Hospital in Mexico City; past president of the Greene County Medical Society; served in France during World War I; died January 9, aged 73, of coronary thrombosis.

Sidney Edward Smith, Woodhaven, N. Y.; New York Homeopathic Medical College and Hospital, New York, 1892; died December 30, aged 86, of cerebral hemorrhage.

Henry Loring Staples, Minneapolis; Medical School of Maine, Portland, 1886; died December 23, aged 86, of carcinoma of the stomach.

Willian Gale Stinchcomb, Bellefontaine, Ohio; Bellevue Hospital Medical College, New York, 1895; member of the American Medical Association; served during World War I; a member of the board of trustees of the Bellefontaine Public Library for twenty-five years, acting as treasurer most of that time; died December 19, aged 74, of pneumonia.

Dickran T. Tabibian, Jackson Heights, N. Y.; University of Vermont College of Medicine, Burlington, 1888; at one time practiced in Turkey and in 1895-1896 served at the capital as United States vice consul; died in the Physicians Hospital December 5, aged 87.

Edward Francis Timmins, Boston; Harvard Medical School, Boston, 1904; member of the American Medical Association; died December 11, aged 64.

Benjamin Franklin Turner ⊕ Memphis, Tenn.; College of Physicians and Surgeons, medical department of Columbia College, New York, 1890; an Affiliate Fellow of the American Medical Association; emeritus professor of neurology at the University of Tennessee College of Medicine; formerly consulting neurologist at the John Gaston and St. Joseph's hospitals; formerly member of the city park commission; died January 8, aged 85, of myocardial failure and peripheral vascular embolus.

Martin Van Raalte ⊕ Chicago; Washington University School of Medicine, St. Louis, 1912; member of the Missouri State Medical Association; assistant roentgenologist at the Cook County Hospital; died December 5, aged 57, of coronary thrombosis.

Frank Walls, Chicago; Northwestern University Medical School, Chicago, 1891; professor emeritus of pediatrics at his alma mater; served on the staffs of the County, St. Luke's and Wesley Memorial hospitals; died in Fort Lauderdale, Fla., January 14, aged 76, of arteriosclerotic heart disease.

Sylvester Matthias Welsh, Waukesha, Wis.; State University of Iowa College of Medicine, Iowa City, 1929; began active duty as a captain in the medical corps, Army of the United States, on July 14, 1941; service terminated July 1, 1942; died in St. Joseph's Hospital, Milwaukee, November 26, aged 43, of cirrhosis of the liver.

Levi White, Worcester, Mass.; Bellevue Hospital Medical College, New York, 1872; member of the American Medical Association; died December 1, aged 96, of chronic myocardial degeneration.

The Government Bill for a Comprehensive National Health Service

The National Health Service bill, in which the government has given legislative form to its plans for a comprehensive health service, has at last been published. It provides a personal health service by doctors and dentists, whom the patient chooses, available at health centers at home or at the doctor's own office. Doctors may choose whether or not to join the service, and joining it will not debar them from receiving fees from those who do not wish to take advantage of the state scheme, which will be available to all, free and without qualification or limitation. All forms of general and specialist hospital care and treatment are included. Specialist opinions and treatment of all kinds will be available at hospitals, institutions, clinics, and in the patient's home. The minister of health will be responsible for the service, which will be administered by regional boards. The minister will take over voluntary and public hospitals and others if necessary, the teaching hospitals being given special treatment. Supplementary services will include midwifery, maternity and child welfare, home nursing, a priority dental service for children and expectant and nursing mothers, and domestic help when needed on health grounds. These services will be administered by local health authorities.

THE COST OF THE SCHEME

The cost of the scheme in the early years is estimated at $608,000,000 a year. The government will bear the full cost of the hospital and specialist services, estimated at $348,000,000, and of the family doctor, dentist and pharmaceutic services, estimated at $18,000,000, and will also pay $24,000,000, about half the cost of the services to be administered by the local health authorities. Hospital management committees will be set up for each large hospital or for groups of hospitals. The teaching hospitals will not come within this system but will have separate boards of governors.

THE POSITION OF DOCTORS

The service of family doctors, dentists and pharmacists is to be organized by local executive councils and based on health centers. The members of these councils will be nominated in equal numbers by the major local authorities and the minister and by the local doctors. Each doctor will have his own list of patients whom he has agreed to attend and can use the health centers as surgeries. The patient's freedom in the choice of doctor is not canceled, nor will there be a general direction of doctors. But there will be a certain control of their movement within the national service. Payment of doctors will be partly by salary and partly by capitation fee. The sale of practices which are wholly or partially within the National Health Service will be prohibited, and compensation will be paid to present practitioners for loss of selling values. In agreement with the doctors' representatives $264,000,000 has been fixed for the capital value involved. The distribution of compensation will be left to the profession, and the minister will accept any reasonable proposals within the total sum. Normally compensation will be paid on retirement or death. To meet the needs of unattractive areas which are short of doctors, salaries will be adjusted to induce them to enter these areas.

HOSPITAL AND SPECIALIST SERVICE

This covers hospital and consultant services of all kinds, including general and special services, maternity accommodation, tuberculosis sanatoriums, infectious disease units, provision for the chronically sick, mental hospitals and mental deficiency institutions, accommodation for convalescent treatment and medical rehabilitation, and all forms of specialist treatment, such as orthopedics, cancer, neurosurgery, plastic surgery, pediatrics, gynecology, ophthalmic services and ear, nose and throat treatment. All appliances required by patients, even dentures and spectacles, will be supplied.

THE TEACHING HOSPITALS

Special arrangements will be made for the teaching hospitals. Unlike the other hospitals, they will not be administered by regional boards set up under the bill. Each will have its separate board of governors, which will include members nominated by the university, the regional board for the area, the senior staff of the hospital itself and the previous governing bodies. The endowments of these hospitals will pass directly to the new boards of governors, who are assured that their purposes will still be observed as far as possible.

HEALTH CENTERS

A main feature of the general practitioner service is the development of health centers. These will afford means for general medical and dental services and also for many of the special services and sometimes for outpost clinics of the hospital and specialist services. They will provide doctors with equipped and staffed consulting rooms and also will be able to serve as bases for various activities in health education.

THE REACTION OF THE MEDICAL PROFESSION

Though attempts have obviously been made to meet some of the objections to the proposals of the government, the bill is unacceptable to the great majority of the medical profession on fundamental grounds. They entirely reject the principle which animates the socialist government—that the best scheme of medical treatment is to be obtained by state control of the profession. At a press conference Dr. Dain, chairman of the council of the British Medical Association, said that the present minister of health, Mr. Bevan, had taken an entirely different line from his predecessors. Members of the association had seen him only twice, and he would not negotiate with them. The association's view was that it was not in the public interest that doctors as a profession should become whole time state servants. The minister proposed to take the responsibility of telling doctors where they should practice and what form of practice they should undertake. Dr. Hill, secretary of the British Medical Association, said that the immediate reaction to the proposals was that they would lead sooner rather than later to doctors becoming whole time salaried servants of the state. That was a form of service that they believed to be contrary to the public interest. Meetings of members and nonmembers of the association would be called in every part of the country during the first fortnight of April. A special representative meeting of about 250 delegates would be held in London on May 1 and 2. The council of the British Medical Association is to submit for the information of the profession 56,000 copies of a report on the bill, which will be accompanied by a statement. It is pointed out that it is in the patient's interest that the doctor should be independent within his field. Inevitably there will be an urge on the part of the state to cut short all sickness and save funds and man power. The taking over by the state of all hospitals must cause a loss of local interest and discouragement of contributions.

The attitude of "the leading independent weekly medical journal," the *Lancet*, is summed up by the *Times* as "a cautious acceptance of the proposals." It admits that "to a profession of individualists the whole conception of government control is repugnant." To some it would seem to mean the triumph of bureaucracy over medicine, but there is another possibility, the triumph of medicine, in its own field, over bureaucracy. "Even if doctors became civil servants, the nature of civil service is changing before our eyes, for the enlarging machinery of the state is demanding the care of more and more technicians. In any medical service professional opinion adequately expressed is bound to command attention. We should ask ourselves whether, with all its risks, the service contemplated does not give us opportunities."

BRAZIL

(From Our Regular Correspondent)

Rio de Janeiro, March 22, 1946.

Incidence of the Rh Factor

Dr. Humberto C. Ferreira, Dr. Carlos S. Lacaz and Dr. Oswaldo Mallone of the Department of Microbiology and Immunology of the University of São Paulo have recently reported a study of the Rh factor in 260 white inhabitants of São Paulo using anti-Rh serum furnished by the Blood Transfusion Association of New York. Of these, 222 were Rh positive (85.4 per cent) and 38 were negative (14.6 per cent). This result does not differ significantly from the findings of Landsteiner, Wiener, Tisdall and Garland in white populations. In 249 persons of known blood type the results were as follows: in 139 persons of type O there were 116 Rh positive (83.5 per cent) and 23 negative (16.5 per cent); in 92 persons of type A there were 85 Rh positive (92.4 per cent) and 7 negative (7.6 per cent); in 15 persons of type B there were 13 Rh positive (86.7 per cent) and 2 negative (13.3 per cent) and in 3 persons of type AB all were Rh negative. There was a significant difference between the two sexes: in 106 males there were 95 Rh positive (89.6 per cent) and 11 negative (10.4 per cent) and in 154 females there were 131 Rh positive (85.1 per cent) and 23 negative (14.9 per cent).

Preparation of Antiscorpionic Serum

The frequency of scorpion bites in the region of Belo Horizonte, Minas Gerais, has emphasized the importance of antiscorpion serum. In 1928 production of the serum was initiated at the Minas Gerais branch of the Oswaldo Cruz Institute, under the direction of Dr. Octavio Magalhães, by the intravenous injection in bovine animals of increasing doses of scorpion venom (standardized in recently captured gray mice). After the foundation of the Minas Gerais State Institute of Chemistry and Biology Dr. A. Viana Martins was placed in charge of the preparation of antiscorpion serum. In a recent report Dr. A. Viana Martins of the Minas Gerais State Institute of Chemistry and Biology described improvements in the preparation of antiscorpion serum which include (1) the use of the horse as a source of blood serum, (2) the use of anavenom instead of venom as antigen, (3) subcutaneous instead of intravenous injection for immunizing inoculations and (4) the use of guinea pigs instead of gray mice for standardization. Bovine animals are not used for serum because of (*a*) the low yield of serum despite the possibility of hemorrhage due to small contractility of clot in bovine blood, (*b*) toxicity of bovine serum for certain laboratory animals and for man, particularly when used intravenously, (*c*) the possibility of anaphylactic shock in patients due to sensitization from bovine meat and milk as food and (*d*) the lesser docility of the animals. Fatal toxic accidents in test animals are prevented by the substitution of anavenom for venom as antigen. The anavenom is prepared as follows: Venom of Tityus serrulatus is obtained by grinding vesicles and is then diluted in isotonic solution of sodium chloride. One per cent of formaldehyde is added and the solution kept under toluene at 4 C. for forty days. This transformation into anavenom reduces the toxicity of the venom but does not change its antigenic power. Toluene, acting as a preservative, maintains the sterility of the anavenom solution and thus allows subcutaneous inoculation without the formation of large abscesses. The inconvenience of using recently captured gray mice is avoided by the substitution of guinea pigs for standardization tests. Work is in progress on the use of white mice for this purpose. With these changes in technic, potent antiscorpion serum is now produced more rapidly and more economically.

Brief Items

Gen. Florencio de Abreu, surgeon general of the Brazilian army medical corps, and Col. Isler Vieira, assistant surgeon of the medical corps, have left for the United States as guests of the American government, to study the organization of the U. S. Army Medical Corps.

Dr. J. Moura Moniz has been appointed professor of Bacteriology at the University of Rio de Janeiro to succeed Dr. Bruno A. Lobo, who died recently.

Dr. Delfino Pinheiro Cintra, professor of pediatrics at the University of São Paulo, reached the age limit and retired from active duty.

Dr. Raphael Paula Souza, professor of phthisiology at the University of São Paulo, has been appointed director of the Division of Tuberculosis of the National Department of Health.

Dr. H. Sampaio Correa has been appointed director of the Department of Health of the state of São Paulo.

Dr. Alberto Borgerth, surgeon of the Department of Hospitals of Rio de Janeiro, has been appointed director of the department.

Dr. Luciano Gualberto, professor of surgery at the University of São Paulo, left for the United States as guest of several American universities, where he will present surgical procedures for salpingectomy, hysterectomy and nephropexy.

Dr. Adelmo Machado, medical superintendent of the Hospital Couto Maia of Salvador, state of Bahia, died recently at the age of 49.

Personal

Dr. B. Paula Santos Jr., associate professor of ophthalmology at the University of São Paulo, has been appointed head of the Division of Trachoma of the São Paulo State Department of Health, succeeding Dr. Sylvio A. Toledo.

Marriages

William Crane Cantrell, Hamilton, Ala., to Lieut. Doris Melvin, Nurse Corps, U.S.N., of Birmingham in San Diego, February 28.

Horace A. Albertson, Richmond, Va., to Mrs. Marie Patterson Van Antwerp of Berkeley, Calif., at Fort Shafter, Honolulu, recently.

Frank Neville Buck Jr., Portsmouth, Va., to Miss Alice Marjorie Marshall of Louisia, December 21.

Merton Louis White to Miss Catherine Margaret Field, both of Washington, D. C., January 12.

John Clarence Taylor, Anderson, S. C., to Miss Maxine Carpenter in Opelousas, La., January 25.

Catherine Johnston, Bloomfield, Pa., to Mr. John B. Moore of Clincho, Va., February 9.

Russell L. Fankhouser of Pine Grove, W. Va., to Patricia Dodd of Savannah, Ga., March 4.

Robert Torrance Cale to Miss Ruth Varnon, both of Birmingham, Ala., January 25.

Hugh Browning Walker to Miss Annette Coffey, both of Kansas City, Mo., February 17.

Ralph Hogshead Jr., Albany, Ga., to Miss Ruth Cheney of Morgan, February 16.

HYPOGLYCEMIC FATIGUE

To the Editor:—Following the publication of the article Hypoglycemic Fatigue by Karlan and Cohn in the March 2 issue of The Journal, in which it was pointed out that no beneficial effects with atropine were obtained in cases of hypoglycemia, one of us had an opportunity to discuss the paper with Dr. Portis. Dr. Portis and Dr. Alexander had observed elevation of the blood sugar, normal glucose tolerance curves and relief from symptoms in other cases of hypoglycemia after the administration of atropine. As a result of our talk it is felt that two points in our paper should be reemphasized. In our cases atropine did not prevent the occurrence of hypoglycemic blood levels during the course of our intravenous glucose tolerance tests. It must be admitted that in 4 of our cases injected glucose was removed from the blood at a slower rate after atropine than without it. However, by carrying out our tolerance tests for three hours rather than two hours, as Portis did, we observed the same degree of hypoglycemia regardless of whether or not atropine was administered. In the second place, atropine did not remove or ameliorate the subjective symptoms in our patients. It is therefore felt that Portis was observing a different type of hypoglycemia than the one we encountered. It seems probable that there may be innumerable causes for so-called "idiopathic" hypoglycemia. We may have observed one type not influenced by atropine, while Portis and Alexander studied an entirely different etiologic group. The lack of correlation between the results in the two groups would seem to indicate this conclusion.

Clarence Cohn, M.D., Philadelphia.

BOMBING AND HEALTH

To the Editor:—Re: the editorial "Bombing and Health," page 638, Vol. 130, No. 10, dated March 9, 1946.

As chief of the Morale Division, U. S. Strategic Bombing Survey, under whose direction the Medical Sciences Branch of this survey operated, may I express the appreciation of each and every officer, enlisted man and civilian member of the U. S. S. B. S. whose combined efforts made the report possible. Your editorial is indeed a well earned compliment for them.

May I correct for the record two minor errors in the editorial:

1. Although Dr. Brandt was condemned to death on April 18, 1945 and the death warrant was signed by Hitler personally, Dr. Brandt was not executed. The conspiracy between Dr. Speer and Himmler versus Borman, Goebbels and Hitler resulted in Dr. Brandt's being repeatedly saved from execution and finally freed by Dr. Speer in May 1945 to join the so-called Doenitz government in Flensberg. It was at Flensberg that Dr. Brandt was arrested by the Allies on May 17, 1945 (U. S. S. B. S. interview 64, Prof. Dr. med. Karl Brandt, June 17-18, 1945). The last statement on page 339 of the Medical Report is misleading.

2. In Hamburg the heavy raids began the night of July 27, 1943 and four night raids followed during the next seven days. Thus in truth five raids killed approximately 50,000 people in those seven days of August and July 1943. (The German secret report available in the U. S. S. B. S. files in Washington tells what this means in terms of medicine and health not alone to the one city but to the nation.)

Again our sincere appreciation for your editorial.

Richard L. Meiling, M.D., Cleveland.

HODGKIN'S DISEASE AND GIANT FOLLICULAR LYMPHADENOPATHY

To the Editor:—Under the editorial comment entitled "Hodgkin's Disease and Giant Follicular Lymphadenopathy" in The Journal, March 16, the statement is made, referring to giant follicular lymphadenopathy, "it is curable by mild x-ray therapy." This is incorrect in the opinion of most students of the disease. Although Brill, Baehr and Rosenthal (The Journal, Feb. 28, 1925, p. 668) originally thought this condition benign, they have since reversed this opinion and Baehr, Klemperer and Rosenthal (*Am. J. Path.* **3**:550, 1927) look on the disease as a form of lymphosarcoma, which it resembles both clinically and, in later stages, pathologically. Although usually highly responsive to roentgen rays, the disease slowly progresses, has the course of a malignant neoplasm and in our experience is invariably fatal.

I bring this to your attention for the statement of curability, if transmitted to relatives of patients, will lead to unnecessary later distress for the patient, the relatives and the physician.

Ovid O. Meyer, M.D., Madison, Wis.

Bureau of Investigation

CEASE AND DESIST ORDERS

Abstracts of Certain Federal Trade Commission Releases

The work of the Federal Trade Commission in helping to protect the public against misrepresentation or fraud in the medical as well as other fields, has been greatly extended by the provisions of the Wheeler-Lea Amendment to the Federal Trade Commission Act. The Food, Drug and Cosmetic Act of 1938 increased the Food and Drug Administration's control of the advertising claims and statements made on the label of a medicine or on the carton or in the accompanying leaflet, whereas what might be termed collateral advertising, that which appears in circulars, newspapers and magazines and over the air, comes more actively under the purview of the Federal Trade Commission by virtue of the Wheeler-Lea Amendment.

The Journal has at various times commented on the activities of the Federal Trade Commission in this connection, even before the Wheeler-Lea Amendment gave it its added powers. In some cases the Commission may accept from the person or concern involved a stipulation that the objectionable practices or claims cited will be discontinued. In other cases the Commission issues what is known as a Cease and Desist Order, in which the individual, manufacturer or distributor cited is ordered to cease and desist from practices which have been declared objectionable. In some cases the claims cited have been discontinued by the firms several months (or even longer) before the issuance of the order. Abstracts of some of the orders issued in 1943, 1944 and 1945 follow in this form: name of product, name of distributor, date of issuance of complaint, date of issuance of Cease and Desist Order and terms of order.

Dr. Pierce's Purgative Pellets and Ward's Bile Salts Compound and Cascara Tablets.—Montgomery Ward & Company, Inc., Chicago; complaint issued Sept. 25, 1943; order issued April 9, 1945. Order directed respondent to discontinue any advertisements which failed to reveal that the products in question should not be used in the presence of abdominal pains, nausea, vomiting or other symptoms of appendicitis. It was provided, however, that such advertisements need contain only the statement, "Caution: Use only as directed," if the labeling instructions carried a warning to the same effect.

Indian Herbal Roots.—Gladys Goldberg, trading as Wakita Herb Company, New York; complaint issued Dec. 7, 1943; order issued Sept. 9, 1944. Order directed respondent to discontinue representations that the product is an effective treatment for nervousness, insomnia, or a sick, burning stomach; that it has any value in the treatment of poor appetite, back pains, headaches or a gassy stomach, beyond providing temporary relief when such symptoms and conditions are due to constipation; that these disorders are usually caused by constipation; that the preparation will restore energy or vitality, rid the body of accumulated poisons, and is not habit-forming. The order further directed Miss Goldberg to cease using the words "Indian" and "roots" as parts of the trade name or otherwise representing that the mixture is compounded from roots, or that its ingredients were used by the American Indians. The Commission found that the product is an irritant laxative and potentially dangerous when taken by one suffering from symptoms of appendicitis. The order required the respondent to discontinue any advertisement that did not reveal that the mixture should not be used in the presence of such symptoms. It was provided, however, that the advertising need contain only the statement, "Caution: Use only as directed," if the directions for use on the label or in the labeling carry a warning to the same effect.

Lady Ashton Foot Ease.—William H. Howe, Lowell, Mass.; complaint issued Dec. 3, 1943; order issued March 17, 1945. Order directed respondent to discontinue any advertisements which represented that his preparation would remove calluses or assist in their removal beyond temporarily softening the outer layers, that the product will relieve foot discomforts or tired, aching feet in excess of possibly affording temporary relief from such symptoms when used with foot bath and massage.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Workmen's Compensation Acts: County Tuberculosis Nurse Not Under Automatic Provisions Thereof.—The plaintiff claimed compensation for injuries resulting from an automobile accident which occurred during the course of her employment with the defendant, Christian County. From an award in her favor, which was affirmed by the circuit court, the county appealed to the Supreme Court of Illinois.

The plaintiff, a registered and certified public health nurse, was, for many years prior to Oct. 12, 1942, employed as county tuberculosis nurse by the board of directors of the tuberculosis sanatorium fund of the county of Christian. Her duties included interviewing patients, directing them to the clinic and giving them instructions, following up newly discovered cases at the clinic, making calls on patients at the sanatoriums and in their homes, interviewing doctors and hospital authorities, and investigating "borderline" cases to ascertain whether her own or an adjoining county was responsible for their hospitalization. She made a report each month to the sanatorium board and prepared an annual or semiannual report for use by the sanatorium board in making its report to the board of supervisors of the county. She was furnished an office in the county court house, where she wrote letters and often interviewed patients, but most of her work was done in the field. The automobile which she used for all this field work was purchased and maintained by the sanatorium and was placed completely at her disposal. On Oct. 12, 1942, while she was operating this automobile in the course of her work, the car collided with another vehicle and she received the injuries for which the award in question was granted. On appeal, the defendant county contended that the plaintiff was not entitled to compensation on the ground, among others, that she and the county of Christian were not operating under and bound by the provisions of the workmen's compensation act at the time and place of the occurrence of the accidental injuries. The plaintiff, on the other hand, contended that in the maintenance of the Christian County court house the county was engaged in an extrahazardous enterprise because it was subject to statutory and municipal ordinance regulations which automatically brought such enterprise within the extrahazardous provisions of the workmen's compensation acts; that therefore one department of her employer's business of providing treatment for tuberculous persons, namely the maintenance of the office or administrative department, was extrahazardous because conducted within the court house; that if one department of an enterprise or business is extrahazardous, then all of its departments are extrahazardous and all of its employees are entitled to the protection of the act; that this is true regardless of whether or not they are employed in the extrahazardous department or within the extrahazardous building at the time the injuries are received.

Section 3 of the workmen's compensation act provides that the act shall apply automatically and without election to all employers engaged in any enterprise in which statutory or municipal ordinance regulations are imposed for the protection and safeguarding of the employees or the public therein. The Supreme Court said that the regulations referred to in section 3 clearly meant regulations imposed on the enterprise of the employer. Continuing, the court said that an employer may conduct different and distinct businesses or enterprises, some of which automatically fall within the act and some of which do not, but the fact that it is engaged in a business or enterprise which is within the act creates no liability as to injuries sustained by an employee in another and different business or enterprise conducted by it which is not within the act. Assuming, said the court, that the court house is subject to such regulations, it is still essential that these regulations are imposed on the particular enterprise in which the county, as plaintiff's employer, is engaged and not merely some other and different enterprise in which the county is also engaged. The county of Christian, the court pointed out, is engaged in many more activities than just furnishing care and treatment to its tuberculous inhabitants; for one thing it maintains the court house building. The liability of the county arising because of the extrahazardous business of maintaining the court house, however, extends only to accidental injuries sustained by employees actually engaged in some act incidental thereto. Plaintiff's duties as tuberculosis nurse had no connection with and were not incidental to the business of maintaining the court house, said the court. The court then discussed the regulations relied on by the plaintiff and held that they did not bring the county, in its business of furnishing assistance to tuberculous inhabitants, within the extrahazardous provisions of the workmen's compensation act. The Supreme Court therefore concluded that the enterprise in which the plaintiff was employed at the time she sustained the accidental injuries for which she is claiming compensation was not subject to the workmen's compensation act and the judgment in favor of the plaintiff was accordingly reversed.—*Christian County v. Industrial Commission, 63 N. E. (2d) 515 (Ill., 1945).*

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1936 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Typhoid Caused by Orange Juice: Value of Immunization.—Duncan and his associates report a small localized epidemic of typhoid, which occurred in a residential hotel for business women. A woman preparing the orange juice had Eberthella typhosa in her stool, and the Widal test for this woman showed for the H antigen plus-minus in a dilution of 1 : 80 and for the O antigen positive in a dilution of 1 : 160. All but 1 of the patients with typhoid were known to have consumed orange juice. As supporting evidence, orange juice was inoculated with typhoid bacilli isolated from the carrier and incubated at room temperature. Viable bacilli were recovered up to six days after inoculation. It was found that only 1 case of typhoid occurred among the 211 persons who had been immunized against typhoid, while there were 17 among the 140 who had not been immunized.

Penicillin and Sulfadiazine in Water Soluble Base for Sinusitis.—Pugmire and Eberle in treating suppurative sinusitis used a mixture which contained 4 per cent of sulfadiazine and 20,000 units of penicillin in 1 Gm. of moderately thin water soluble ointment base. It is easily injected through a 15 gage trocar used for ordinary antral lavage. Following ordinary lavage with isotonic solution of sodium chloride the mixture is instilled into the sinus and allowed to remain until the next irrigation, which is usually forty-eight to seventy-two hours later. This subsequent lavage showed a remarkable reduction in the amount of pus present, with little or none of the mixture remaining. It was necessary to repeat this procedure two or three times to obtain a pus free or 1 plus pus washing. In most cases the patient was clinically symptom free with only a slight clear postnasal drip present after a period of three to four weeks. Two or three subsequent lavages were done after the first clear washing was obtained to make certain that residual pus was not present. Five cases were selected at random, regardless of past history and treatment. All were pus free after one to five or six lavages, and there has been no recurrence.

Penicillin in Streptococcus Viridans Endocarditis.—Hirsh and Dowling employed penicillin in the treatment of 10 patients who had typical symptoms of bacterial endocarditis. The authors administered penicillin continuously by vein to the first patients but soon found that this method was not practical. To the patients treated subsequently, penicillin was administered for a few days by the continuous intramuscular method or by intramuscular injections at two hour intervals. When the continuous intramuscular or intravenous method of administration was employed, the dose was 200,000 units for each twenty-four hour period. Most of the patients who were given intermittent injections received 25,000 to 30,000 units every two hours until the blood cultures had become sterile and the fever had subsided. Thereafter they were given 20,000 units every two hours until the eight week treatment period had been completed. One patient died after twelve, another after twenty-one and the third after nineteen days of penicillin treatment. The fourth patient died six months after the completion of penicillin therapy. Six of the 10 patients treated with penicillin have remained free from all evidences of infection for from four to twelve months. Age, sex, color, valvular involvement and duration of infection were not factors in the ultimate prognosis of these patients. The presence of a serious complication before treatment did not necessarily preclude recovery. It is concluded that patients with endocarditis should be treated with penicillin for a period of eight weeks. By this method relapses are apparently avoided.

Intravenous Gelatin for Nutrition.—Brunschwig and his associates describe studies on gelatin as a parenteral nitrogenous nutriment. The gelatin employed was prepared from pigskin, autoclaved several times and made up into an 8 per cent solution in isotonic solution of sodium chloride. The aim was to determine whether intravenous gelatin is utilized for synthesis of the organism's own proteins (plasma proteins in particular). Experiments on dogs revealed that gelatin administered intravenously is at least partially utilized for regeneration of plasma proteins. Clinical experience indicates that intravenous gelatin constitutes one method by which nitrogenous substances for nutritional purposes may be administered. Nitrogen in such form is anabolically utilized.

Reflex Sympathetic Dystrophy.—According to Evans, reflex sympathetic dystrophy is a most disabling, often extremely painful, malady following minor sprains, ordinary fractures or trauma to blood vessels or nerves. The syndrome is characterized only at times by the excruciating, burning pain that has given it the term "causalgia," hence a misnomer. Pain may be moderate, mild or absent. The true diagnostic features are disorders initiated by perversions of reflex sympathetic stimulation, such as rubor or pallor, sweating, edema, atrophy of the skin and spotty or even cystic atrophy of bone. In the past year the author has gathered mainly from the orthopedic service, from the neurosurgical service and from the medical and surgical services of the Lahey Clinic 32 cases of reflex sympathetic dystrophy. The causal trauma or diseases included sprain, fracture, thrombophlebitis, bruise, amputation and anterior poliomyelitis. Rubor was present in 15 and pallor in 9 cases. Swelling or sweating or both was present in over half of the cases. Atrophy of the skin was noted in 4 and of muscle in 7 patients. The typical bone atrophy of sympathetic origin is mottled, in advanced cases even cystic (Sudeck's syndrome). Diagnosis depends largely on the demonstration of relief by sympathetic procaine block. In 9 patients treated by sympathetic procaine block alone 7 had relief of pain varying from three weeks to permanent. The other 2 received relief of pain only for the duration of the procaine effect. Thirteen patients of the 32 had sympathectomy performed, with relief of pain ranging from 75 to 100 per cent in 9. The 2 patients without pain but with other sympathetic phenomena have not submitted to either block or sympathectomy.

Decortication in Acute Empyema Thoracis.—According to Sanger, the radical management of empyema thoracis in the acute and subacute phases is an attempt to eliminate chronic empyema. On the basis of war experience the author has formed the following opinions: 1. Closed or open drainage (thoracostomy) is the procedure of choice in small and moderate sized, unilocular, post-traumatic or postpneumonic empyema 2. Thoracotomy with evacuation of the pleura and decortication of the lung is the procedure of choice in multilocular empyema and in total empyema with collapse of the upper lobe. In this group fall both post-traumatic and postpneumonic infections, including those which develop in large clotted hemothoraces. The technic of pulmonary decortication used by the author was essentially the same as that described by Burford and Samson

Therapeutic Action of Paludrine on Acute Benign Tertian Malaria.—In 147 cases of acute benign tertian malaria doses varying from 10 mg. to 700 mg. every twelve hours for from fourteen to twenty-eight days were administered. Clinical cure was obtained in all cases. Serious side effects were not observed. The plasma concentrations and urinary output of the drug were determined in groups of patients and volunteers taking doses of 50 mg. and 500 mg. every twelve hours for fourteen days.

*Use of Penicillin in Acute Infections of Hand. J. F. Curr.—p. 469.

Penicillin in Acute Infections of Hand.—Curr describes an investigation to determine the efficiency of penicillin in acute infections of the hand. Penicillin crude filtrate of a concentration of 80 units per cubic centimeter was used in 60 cases. At the time of operation, and daily thereafter for a week, it was introduced into the wounds either in lightly packed dressings or through fine rubber tubes, also acting as drains. The effects were uniformly undesirable, as the wounds and adjacent healthy skin became sodden and tender and a heavy growth of coliform organisms appeared. The results were not as good as in the control series, and penicillin crude filtrate was condemned in the treatment of hand infections requiring incision. Penicillin lanette wax cream of a concentration of 500 to 1,000 units per gram of cream was used in 109 cases, being introduced into the operation wounds daily for a week, when necessary along a blunt wide bored needle. With few exceptions the results were not better than control methods. Most incisions of the hand were unsuitable for the introduction of a powder. Administration of penicillin by continuous intramuscular drip in a daily dose of 100,000 units for five days was utilized in 39 cases of acute tenosynovitis, with encouraging results. Penicillin mixed with beeswax or peanut oil was injected intramuscularly twice daily. The results were not encouraging in 3 cases.

Anti-Pernicious Anemia Factor.—Jacobson and Williams tested substances which were likely to be found in liver extracts. The following substances injected intravenously into splenectomized rabbits failed to produce reticulocyte response: ascorbic acid, vitamin B_1, calcium pantothenate, pyridoxine and nicotinic acid amide, a biotin preparation the exact concentration of which was unknown and lactoflavin. Tests with amino acids and peptone likewise gave a negative reticulocyte response. Purines were tested because it was found that pterines, which are chemically related compounds, produced a reticulocyte response. None of the purines gave a positive reticulocyte response, and iron likewise failed to give a reticulocyte response. Thus it was considered reasonable to rule out all these impurities as the cause of the reticulocyte response to liver extracts. Clinically inactive liver extracts failed to produce a response. Injections of extracts of crypts and villi of the small intestine and of an argentaffine cell tumor (carcinoid), synthetic xanthopterin, leukopterin and the pigment derived from fused uric acid gave a reticulocyte response in the splenectomized rabbit. These observations suggest that pterines play a part in erythropoiesis. The presence of pterines in preparations of liver and intestine and the activity of xanthopterin and leukopterin in splenectomized rabbits does not mean that pterines are identical with the anti-pernicious anemia factor, but it strongly suggests that they are a constituent of the active principle.

Penicillin in Gonorrhea. S. M. Laird and A. B. Fieldsend.—p. 53.

Subacute Necrosis of Liver Without Icterus.—Lawrence describes a case of subacute necrosis of the liver in which jaundice was absent. The treatment should be as for subacute necrosis with jaundice. The diet should be high in carbohydrate, and during a relapse the patient should rest in bed and receive additional dextrose and insulin. A hypochromic anemia should be treated with iron. For the edema vitamin B_1 is worth a trial, particularly if polyneuritis is also present; transfusions of blood or plasma cause a temporary improvement and serve a dual purpose, for depletion of plasma protein renders the liver more susceptible to damage. Repeated paracentesis may be necessary for the ascites. The edema is due to a reduction of the serum albumin, resulting apparently from inadequate formation of these constituents in the liver.

Mycophenolic Acid, an Antibiotic from Penicillium Brevi Compactum Dierckx.—Florey and his associates incubated overnight at 37 C serial dilutions of sodium mycophenolate in 5 cc of broth inoculated with one drop of culture of various bacteria The results show that the action of mycophenolic acid is stronger against the gram-positive than against the gram-negative organisms, and that the inhibitory effect, as read after sixteen to eighteen hours' incubation, is strikingly affected by the size of inoculum used Thus the titer for complete inhibition of the staphylococcus was sixty-four times greater when the inoculum was a thousand times less After experiments on the toxicity, absorption and excretion of mycophenolic acid experiments were undertaken to find out whether it inhibited fungi as well as bacteria The fungi chosen were those which could readily be grown in culture Fourfold dilution series of mycophenolic acid, from 1 5,000 upward, were set up in liquid Sabouraud's medium and inoculated with the fungi The following species were inhibited Stereum purpureum, Verticillium dahliae, Claviceps purpurea, Phytophthora erythroseptica, Rhizoctonia crocorum and Rhizoctonia solani

Hepatitis After Penicillin Injections.—Howells and Kerr treated in military practice 47 patients with hepatitis who had received penicillin injections Of the 47 patients, 36 had received penicillin treatment at the same venereal disease treatment center The average period between injections and onset of icterus was 97 days, with a lower limit of 62 days and a higher limit of 157 days In view of the high proportion of patients who had received their penicillin treatment at the same center, the authors visited it and discussed the problem During the period concerned 1,600 cases were treated with penicillin injections at this center As a routine each syringe is used for about 5 patients Needles are cleaned after each injection It is thought that penicillin is not the direct cause of the hepatitis, which may be due to some icterogenic agent, e g a virus, transmitted by faulty injection technic The fact that so many cases had been treated at the same center, together with the length of the latent period, favors this theory, and it seems likely that the cause is analogous to that responsible for late jaundice after antisyphilitic arsenical therapy

Traumatic Late Hemorrhages in Brain and Meninges.—From his study of 27 cases of brain hemorrhage Harbitz concludes that while the possibility of traumatic late hemorrhages cannot be excluded such cases are rare Traumatic and spontaneous subarachnoid hemorrhages (including those due to aneurysms) are frequent and often recurrent, i e late hemorrhages Arteriosclerosis and syphilitic arteritis in the brain, which may often be latent become manifest after trauma of the head and are rapidly aggravated

Pernicious Anemia and Cancer of Stomach—Only four cancers of the stomach in 18 patients with pernicious anemia were operable In 2 instances cancer and pernicious anemia were discovered at the same time, in 4 pernicious anemia occurred after gastric resection In 11 cases the cancer developed more than three years after the pernicious anemia Few patients, according to Waldenstrom, could expect to have greater prospects for early diagnosis of cancer of the stomach than those under constant control because of their pernicious anemia Since the majority of treated cases of pernicious anemia are without gastric disturbance in spite of their achylia, the occurrence of such symptoms should be a significant warning A tendency to low serum iron values and low color index are regarded as important signs Routine determination of the serum iron every six months in patients controlled for pernicious anemia would contribute to early diagnosis of cancer of the stomach A low color index is an indication for roentgenography

Quinidine in Auricular Fibrillation—Laake reports that of 34 patients with auricular fibrillation the condition responded to treatment with quinidine in 23 and has been so maintained for over three months in 16 The earlier the change to sinus rhythm occurs the better the prospect for permanent regularization It is essential for good results that the fibrillation has not been present for more than six months Slight cardiac enlargement does not seem to affect the result All patients received preliminary digitalis treatment

Roentgenologic Examination of Size of Heart in Elderly Persons—Roentgen examination was made in 200 persons over 70, of whom all but 17 had organic heart disease and/or hypertension Jervell and Vold conclude that coronary sclerosis will cause dilatation of the heart even though the blood pressure is normal As a result of the cardiac dilatation asystolia with or without fibrillation will set in at some time Frequently, as in angina pectoris, the heart is not enlarged in spite of the electrocardiographic changes Of 33 patients with normal blood pressure 21 had an enlarged heart Exclusive of patients with rheumatoid and syphilitic heart disease the heart was dilated in 89 of 121 patients with hypertension

Book Notices

Penicillin in the Treatment of Infections. By Chester S. Keefer, B.S., M.S., M.D., Wade Professor of Medicine, Boston University School of Medicine, Boston, and Donald G. Anderson, A.B., M.D., Instructor in Medicine, Boston University School of Medicine, Boston. Edited by Henry A. Christian, A.M., M.D., LL.D., Clinical Professor of Medicine, Tufts College Medical School, Boston. [Reprinted from Oxford Loose-Leaf Medicine with the same page numbers as in that work.] Cloth. Price, $1.50. Pp. 201-249, with 14 illustrations. New York, London & Toronto: Oxford University Press, 1945.

This is a systematic and workmanlike review of the current status of penicillin in its most familiar therapeutic applications. In a field developing as rapidly as penicillin therapy, it was perhaps inevitable that any such book would be somewhat inadequate by the time it could be published. We believe the list of penicillin-sensitive organisms given here could now be made somewhat more inclusive; likewise the list of penicillin-resistant organisms. The discussion of penicillinase seems scarcely to do justice to this rather useful laboratory agent. The subcutaneous injection of penicillin might have been more clearly revealed as unsatisfactory and undesirable. Something more might now be said about oral administration, although this was perhaps difficult at the time this section was written. Topical therapy by means of troches and ointments would seem to be worth discussion at this time. Another important form of administration, the aerosol, must now be seriously considered, and adequate discussion of this method would be of much interest.

Urethrocystography in the Male with Special Regard to Micturition. By Nils P. G. Edling. From the Roentgen Diagnostic Department of Karolinska Sjukhuset, Stockholm, Paper, Price, Cr. 20. Pp. 144, with 66 illustrations. Stockholm: P. A. Norstedt & Söner, 1945.

In this monograph the author describes and illustrates the urethrocystographic findings in men. The material consists of normal and pathologic cases. The normal material consists of 21 urethrocystographies and the pathologic of 216. The findings obtained by injecting the urethra and bladder with contrast mediums through the external urethral orifice are compared with the roentgenograms obtained during the act of micturition. The book is well written and the subject matter presented in a systematic manner. The author begins with a careful survey of the literature. Then follows an anatomic and physiologic survey. In his discussion of the technic he also calls attention to the possible complications. The illustrations are clearcut and are faithful reproductions. The wide variety of lesions studied permits the author to arrive at certain conclusions regarding micturition. The reproductions of the cystourethrograms during micturition are all that could be desired and are exceedingly interesting and instructive. Apparently the war made some of the recent literature unavailable to the author. This is unfortunate, especially in view of the fact that so much recent work along this line has been done in this country on patients with prostatic obstruction—truly, more than in any other country—and yet one fails to find mention of it. This type of monograph should be of great interest to the physiologist, the urologist and the roentgenologist.

American Pharmacy: Fundamental Principles and Practices, Pharmaceutical Preparations, Biologicals. Editor-in-Chief, Rufus A. Lyman, M.D., Dean, College of Pharmacy, University of Nebraska, Lincoln. Technical Editor, George Urdang, Ph.G., D.Sc.Nat., Director, American Institute of History of Pharmacy, Madison, Wisconsin. Cloth. Price, $8. Pp. 540, with 197 illustrations. Philadelphia, London & Montreal: J. B. Lippincott Company, 1945.

This book is an ambitious, well conceived attempt not only to cover the wide range of contemporary pharmacy but also to rationalize the subject in terms of modern science. In general, this objective seems well achieved, although some of the chapters, particularly those dealing with pharmaceutical products of biologic origin, seem too abridged to convey a basic understanding of the subject.

The discussion of the various pharmaceutical classifications of drugs and their preparations seems quite adequate both for the student and for the practicing pharmacist. Here the subject matter is well selected and treated with scholarly discernment.

The failure to include any dissertation on prescription practice is a defect which militates against its general acceptance. As the dispensing pharmacy is the acme of professional pharmaceutical service, certainly so far as the neighborhood drug store is concerned, it seems reasonable to presume that it would have received serious consideration in a book so comprehensive in scope. Of course, it can be contended that dispensing pharmacy is a textbook subject in itself and hence it was not advisable to include a single chapter condensation of it. But the same contention can quite justifiably be made with respect to many of the subjects to which a chapter was allotted.

Then too the title "American Pharmacy" seems a bit inept, as the scientific data presented, as well as the pharmaceutical technics and manipulations exemplified, are universal and are thus in no sense common to America. The title seems instinctively to impose a limitation on that which is illimitable. All in all the book, while excellent as a whole, suffers from this unnecessary and doubtless unintentional deference to provincialism.

One Hundred Years of Gynaecology, 1800-1900: A Comprehensive Review of the Specialty During Its Greatest Century with Summaries and Case Reports of All Diseases Pertaining to Women. By James V. Ricci, A.B., M.D., Clinical Professor of Gynaecology and Obstetrics, New York Medical College, New York. Fabrikoid. Price, $8.50. Pp. 651. Philadelphia: Blakiston Company, 1945.

Dr. Ricci presents a detailed history of the development of gynecology during the century between 1800 and 1900 A. D. Following a brief introduction entitled "Medical Trends of the Nineteenth Century," he considers the various diseases pertaining to women. The development of medical thought concerning each clinical entity is presented by means of summaries, publications, case histories and pertinent historical references. Thus he presents a complete story covering the pathology, diagnosis and treatment of each gynecologic condition, all of which is thoroughly authenticated by an extensive bibliography. This monumental textbook was made possible by the help of Edward W. Schiels of the Library of the New York Academy of Medicine together with the assistance of Elma Wadsworth. This scholarly treatise on the history of gynecology during the fruitful nineteenth century should be read by every specialist and become an important reference book in his library.

Pharmacopoeia Londinensis of 1618, Reproduced in Facsimile, with a Historical Introduction. By George Urdang. State Historical Society of Wisconsin, Madison, Hollister Pharmaceutical Library, Number Two. Cloth. Price, $12. Pp. 299, with illustrations. New York: Schuman's, 1944.

The facsimile now makes available that rare and almost forgotten first First Edition of the London Pharmacopeia, published by the Royal College of Physicians on May 7, 1618. The book was almost immediately withdrawn from circulation, however, and was replaced on December 7 of the same year by a revised and enlarged edition which was to be recognized as the "First" by dictum, remaining in use as the official guide of physicians and apothecaries until the second was issued in 1650. While formularies had previously appeared on the continent, this was the first Anglo-Saxon attempt, and its effect was in general more far reaching than others had been, becoming the forerunner of other editions of the London Pharmacopeia and finally of our own United States Pharmacopeia.

Of no less interest to having this rare volume made available is the historical review which takes up most of the first hundred pages. Dr. Urdang, with his remarkable gift as a historian, has turned back the years for the reader with his history of this true first. Beginning with a splendid analysis of the background of the day, particularly from the changing medical influences, he has traced the conditions leading to the preparation of the London Pharmacopeia, and particularly has he critically analyzed the two "firsts," in the manner of the true historian and investigator, to find the facts in the case, especially the reasons for recalling the initial book so promptly and replacing it with one which differed in many material respects. His deductions become very fascinating and entirely logical, and undoubtedly he has cleared a phase of medical-pharmaceutical history which had never been examined so critically and thoroughly before.

Two hundred and sixty footnotes provide abundant additional facts pertaining to the book and to individuals bearing on the period, as well as reference material for the one who wishes to make further excursions into fields related to those so entertainingly presented by the author.

Queries and Minor Notes

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards will not be noticed. Every letter must contain the writer's name and address, but these will be omitted on request.

MOTOR TICS

To the Editor:—*A man aged 30 has had a tic for almost fifteen years. At first the condition consisted in spasmodic movements of the shoulder muscles, but gradually some other muscles became involved and at present the patient experiences jerkings occurring in the shoulder and cervicofacial muscles of the right side. The man, an engineer, is much worried about his trouble. Please suggest a plan of treatment.*

Arnulfo Valencia, M.D., Cali, Colombia, South America.

Answer.—Motor tics, limited to a few muscle groups, offer some possibility of alleviation by surgical intervention. Drug therapy is not of value. If a single group of muscles can be isolated, such as sometimes occurs in spasmodic torticollis, either by cutting the muscle or by denervation, the tic may be relieved. This is specially applicable to spasmodic facial tics (German, W. J.: *Surgery* **11:**912 [June] 1942). As in the case described, however, there is often a tendency for the tic to spread by involving adjacent muscles, and more and more operations are required until a point is reached where further cutting would severely incapacitate the patient.

Recently, on the basis that tics originate in or are closely associated with the motor cortex cells, operations on the areas corresponding to the muscles involved have been advocated, similar to the procedures used to remove scars in cases of cortical epilepsy (Penfield, Wilder, and Erickson, T. C.: Epilepsy and Cerebral Localization, Springfield, Ill., Charles C Thomas, 1941). The patient needs to be studied from this point of view, with electroencephalograms, air encephalograms and an evaluation of the spinal fluid. Evidence of birth injury to the brain should be sought, as well as a complete history of previous illnesses, such as meningitis or encephalitis. Should the findings suggest a localized cortical lesion, surgical exploration might be advised, but in view of the involvement of the right side of the body in this patient, who may also be right handed, the possibility of aphasia as a complication from the operation would have to be fully weighed before a decision is reached.

Some patients with tics have responded to psychotherapy, but, without a background of emotional instability or other psychogenic mechanisms, one would not expect an engineer of 30, with a tic of fifteen years' duration, to profit by a prolonged psychologic study. A brief study, however, would certainly be an essential part of any examination, and a more complete investigation could be determined only if profitable lines of psychotherapy were disclosed.

MASSIVE EDEMA FROM THROMBOPHLEBITIS

To the Editor:—*A patient aged 43 following a severe attack of thrombophlebitis in 1931 has developed a tremendously edematous right leg and thigh. My patient, who is overweight, is trying to reduce but, in the meantime, I cannot prevent frequent attacks of severe lymphangitis. The lymphangitis attacks are severe—temperature 105 F.—but were amenable to sulfamerazine and are now even more satsifactorily treated with penicillin injections. What can I do to prevent the frequency of these attacks of severe lymphangitis? I have tried daily sulfathiazole ointment but without avail. Would you suggest ultraviolet therapy to the skin?*

M.D., Illinios.

Answer.—Huge thrombophlebitic edemas are usually a combination of venous and lymphatic obstruction. When acute attacks of lymphangitis occur with chills and fever, the organism may be recovered from the blood stream if a blood culture is obtained as rapidly as possible after the appearance of the chill. Autogenous vaccines can then be prepared so that the patient may receive a series of twelve subcutaneous injections of the vaccine.

Such flare-ups are often initiated by trauma, by a local infection of the foot (ringworm!), by an attack of tonsillitis, or by a respiratory infection. Obviously the lymphatic apparatus of such a patient is in a susceptible state and reacts with great intensity to a small, nonvirulent dose of an organism, which produces no reaction anywhere else in the body. Penicillin or sulfonamides are useful only during the acute attack and should be used in massive doses (200,000 to 300,000 units of penicillin, 120 grains [8 Gm.] of sulfadiazine daily). Eventually some type of autoimmunization takes place, but at the expense of much permanent lymphatic block.

SENSITIVITY TO ASPIRIN

To the Editor:—*A man aged 30, with irrelevant past history or history of allergy within half an hour after ingestion of a 5 grain (0.32 Gm.) aspirin tablet for relief of a simple headache developed an urticarial rash with severe edema and extremely intense pruritis. Seven months later and for the same reason he took a tablet containing acetophenetidin 2½ grains (0.16 Gm.), aspirin 2½ grains and caffeine ½ grain (0.03 Gm.) and again had the same reaction. Both episodes, with gradual subsidence, lasted three days. I should like to know a simple procedure of testing him for sensitivity to aspirin and also to acetophenetidin.*

M.D., New York.

Answer.—There is no successful method for testing drug sensitivity except by clinical trial. Skin tests of various types are not applicable in the study of drug sensitivity. The experience of the patient in this case is enough to make a definite diagnosis of allergy to aspirin. The chemical relationship of aspirin to acetophenetidin is close enough so that the patient also may be sensitive to the latter drug. It is advisable to avoid aspirin even in the minutest doses in such a case, since future reactions may be much more severe than the one noted and may be even dangerous.

EPHEDRINE AND IMPOTENCE

To the Editor:—*A man with bronchial asthma reports that during the asthmatic attacks he takes a moderate amount of ephedrine and for several days thereafter finds himself impotent. I can find nothing about the effect of this drug on a person's ability to get an erection. Is there an association or must the trouble be explained on some other basis?*

Thomas G. Harvey, M.D., Fort Fairfield, Maine.

Answer.—Suppression of erections by ephedrine does not appear to have been reported previously. The wide use of the drug makes it improbable that such action would have been overlooked. Presumably the patient's reaction is a conditioned inhibitive reflex originating from an accidental association.

RETROBULBAR NEURITIS IN PRISONER OF WAR

To the Editor:—*A prisoner of war in the tropics from March 1942 until Aug. 10, 1945 was under unfavorable conditions regarding food (highly polished rice, small quantities of vegetables and dried fish of inferior quality). He is 50 years of age and except for dropsy from December 1944 until April 1945 developed no deficiency disease. The blood pressure was 135/85. In January 1945 troubles with vision started. Two qualified ophthalmologists found the right and left fundus normal. There was a central scotoma, right and left and total paralysis of accommodation. Since liberation the food has become better (calories and protein [canned) and multivitamin tabloids). Up to now there has not been any amelioration. The patient was a heavy smoker. I understand that American doctors have seen and treated similar cases from the Philippines. Although I have worked in the tropics for more than twenty years I have never come across a deficiency disease like this one (so-called neuritis retrobulbaris).*

M.D., Singapore.

Answer.—The syndrome described in this query is evidently that of retrobulbar neuritis. This condition occurs in deficiency diseases and has been described frequently in the literature particularly from the Far East (Verma, O. P.: *Indian M. Gaz.* **77,** November 1942, through *J. Trop. Med. & Hyg.* **46:**7 [Feb.-March] 1943. Guha, G. S.: *Indian J. Ophth.* **1:**103 [July] 1940. Moore, D. F.: *J. Trop. Med.* **42:**131 [May] 1939; *Lancet* **1:**1225 [May 22] 1937). Retrobulbar neuritis, however, may occur independent of deficiency disease. In these cases its response to nutritional therapy is irregular and unpredictable.

The prognosis of retrobulbar neuritis associated with deficiency disease is generally better than that occurring independently and is somewhat dependent on the duration, early cases giving a good prognosis and later cases responding slowly, if at all, to therapy.

Treatment should consist in dietary correction, large doses of the whole natural vitamin B complex (1 to 3 ounces of yeast daily by mouth) and the synthetic vitamins (10 mg. of thiamine hydrochloride, 5 mg. of riboflavin, 50 mg. of niacinamide and 100 mg. of ascorbic acid) by mouth or by intramuscular injection if there is impaired absorption.

TRANSMISSION OF POLIOMYELITIS

To the Editor:—*From a children's camp near Honesdale, Pa., 11 cases of poliomyelitis were reported within two weeks. The source has not been discovered. Should children return to this camp next summer?*

M.D., New York.

Answer.—The means of spread of the virus of infantile paralysis has not been worked out completely. It is, however, recognized that the disease is not one due to a "place infection" but is transmitted from person to person probably both directly and through vectors. Therefore there would appear to be no reason for not recommending a summer camp, dwelling or community because cases were reported there during the previous year.

DEVELOPMENT OF HIGH EDUCATIONAL STANDARDS BY THE MEDICAL PROFESSION

RAY LYMAN WILBUR, M.D.
Chairman, Council on Medical Education and Hospitals, American Medical Association
Stanford University, Calif.

Education has advanced in our republic steadily but unevenly along a very wide front. The differences in economic strength of the various states have made this unevenness of advance especially noticeable in some of the professional fields, particularly in medicine, which for the most part flourishes best in the large centers of population.

In medicine it has been demonstrated that it is possible for a profession organized by county and state, as well as nationally, to have a profound influence on all medical schools, hospitals and educational institutions throughout the nation and also to stimulate legislation by states requiring qualifying examinations and the registration of properly trained professional personnel. All of this has been done chiefly through the cooperation of willing members of the profession and the earnest desire to raise and maintain high standards of professional achievement. It has been done by the physicians themselves, without the power of coercion and primarily through the recognition of unselfish leadership and through the persistent and regular presentation of facts about medical institutions and medical education, and through state laws.

It is remarkable to look back over the last forty years and see how a profession has been able to influence educational institutions that provide its membership, and to see how the confidence of the public has been gained and how prestige has been established. It was forty-odd years ago that the American Medical Association, stung by the charges made of the low quality of many of the nation's medical schools, and stunned with the suddenness of the encroachments of the laboratory into the field of medicine from all directions, organized the Council on Medical Education as one of its constituent councils. The Council went to work in cooperation with the Association of American Medical Colleges and later the Federation of State Medical Boards of the United States, the Advisory Board for Medical Specialties and the American Hospital Association. A considerable part of this widespread and effective program has come from the meetings of the Annual Congress on Medical Education and Licensure, held in Chicago each February by the representatives of the institutions concerned under the auspices of the American Medical Association. The setup of voluntary control has functioned through publicity, the presentation of ideals, the interchange of information, the give and take of discussion and the development of standards without required regimentation.

It all seems very simple as one looks back on it, but there has been a constant struggle over the years between those holding for high standards and willing to fight for them and those seeking to take indirect and unearned advantage of these standards for certain institutions or men without meeting the requirements that at first were voluntary but eventually became mandatory by state legislation.

I have often been asked just what is the power of the Council on Medical Education and Hospitals that has made its actions so effective. One of the most helpful things has been the classification of medical schools as approved, unapproved or on probation after a careful study of the institutions concerned (usually in cooperation with representatives of the Association of American Medical Colleges) and the presentation of ascertainable facts to the institutions and later, if need be, to the profession. Often these facts have been presented on a comparative basis, as was done in Medical Education in the United States, 1934-1939, by the committee headed by Dr. Herman G. Weiskotten, prepared under the auspices of the Council. It has been possible to keep medical education abreast of the laboratories and the many clinical advances made in medicine. The best test of the results that have been obtained has been given in World War II, in which I think one can assert without contradiction that the graduates of the last quarter century from our American medical colleges have done the best practical job in medical care and public health that has ever been done in the history of the world.

Many of these accomplishments have been due to the close linkage between medical education and the universities, also to the development of the hospital as a teaching institution in direct relationship with the staffs of the medical schools. The viewing of the intern year in the hospital as a part of medical education and the residencies in the hospitals as a part of advanced (so-called "postgraduate") medical education has made it possible to classify and issue a public register of hospitals throughout the United States and to indicate those with facilities for training interns and residents.

One of the most important phases of the work of the Council and of its close associate, the Association of American Medical Colleges, has been to keep a personal record of all premedical and medical students and physicians. By maintaining a record from his premedical days to the death of the physician and by the publication of the Directory of the American Medical Association covering the profession and the achievements and interests of its members, a great service has been rendered. That record has become invaluable in the

---

Read before the Forty-Second Annual Congress on Medical Education and Licensure, Chicago, Feb. 11, 1946.

interests of medical men and the movement of patients from one part of the country to another, as well as essential to military and public health services. Innumerable relationships with the medical services have been created. All of this has been accomplished without national legislation.

There has also been established the National Board of Medical Examiners on a voluntary basis but with a high standard. Periodic examinations are given by the National Board and by examining boards of the various specialties. These have done much to protect the public from those who are ill trained in the care of the sick. Over all these years there has been a constant battle against those who, for selfish interest, preferred low standards and the cultists of all sorts who had some short answer for the treatment of human ailments.

Another outstanding achievement is that the internship has become generally recognized as a necessary part of medical education, even though the internship is now required by only six medical schools for the degree of Doctor of Medicine and by twenty-three states and the District of Columbia for a license to practice.

THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION has been a great source of strength in dealing with the problems of medical education. Not only have special issues, such as Hospital Numbers and Educational Numbers, been regularly presented, but educational information has been presented consistently and persistently throughout the year.

In brief, I think that the outstanding job done by the Council on Medical Education and Hospitals has been to raise the general level of medical education throughout the medical schools in the United States without having any power beyond that of classification and the presentation of facts in the publications of the American Medical Association. It has been a strictly American-style job. The Council has set up certain requirements and kept them flexible enough under the guidance of the Council to be effective without being destructive.

Medicine has been in the forefront of the advance of science. Every new scientific discovery has been at once looked over by trained physicians and laboratory men to see whether there could be a possible application to the relief of suffering or to the treatment of the sick. This has meant an elevation in the level of training during the premedical and medical years without which the future doctor could not follow the advance of medical science or understand the results of medical research.

At first it was thought that a general college education leading to the Bachelor of Arts degree was a maximum preparation for the medical course. This did lead to a diversity of preparation which if it had brought about habits of study seemed adequate at the time. It soon became clear, though, that even before admission to the medical school there must be sound training in physics, chemistry, anatomy and biology if one was to take on the medical course without loss of time. Basic science laws had been passed in some states so that those preparing to treat the physical ailments of human beings would have some idea of the science of medicine. A two year college course including chemistry, biology and physics has been recognized as the minimum premedical requirement.

In the four year course in the medical school there has been an attempt made to provide for some training in all the different branches of an advancing science. If a program has been once established in the curriculum, or adopted by a state legislature as the required training for admission to examination for medical practice, it is difficult to change it. I once said that changing an established curriculum was as difficult as moving a cemetery. It still is. Four years and the rotating intern year are none too long to gain a sound medical education; but there is much wastage of time in the present setup. This has come about by overdepartmentalization, emphasis on minor details, the duplication of teaching by representatives of different departments and the long summer vacation.

A LOOK AHEAD

As hospitals and clinics operate throughout the year there is no good reason why much of the clinical teaching cannot be given during the so-called summer vacation period. By the establishment of a four quarter system, making a full use of the summer quarter, it would be possible to cover practically the present four year medical curriculum in the course of three calendar years.

The laboratory and the clinic can and must be brought into close relationship to the patient, with the student participating in all the studies that are made.

Specialization is inevitable, and group practice is desirable. The future of medicine will be played out around medical centers, now existing and to be established, where all the institutions and workers in medicine come together and make a pool of medical knowledge. The volume of medical information is now far beyond the capacity of any one person. If a patient is to have full benefit of what is known then, if his disease is not a simple one, he must come in contact with a number of medically trained men and women organized in a group. The most successful physicians have always been constant students who by the use of books or medical periodicals, conferences, medical societies and visits to clinics have kept in touch with the latest and most efficient methods of diagnosis and treatment. Working in groups makes absences for further study or needed vacation possible without undue losses to patients or physicians.

The costs of medical education are heavy. It will be increasingly necessary for scholarships to be developed so that promising men or women students will not have to interrupt their medical training by outside work in the summer or other times in order to secure funds. These scholarships in some instances can be provided by states in lieu of developing medical schools, many of which have been proposed in places where the clinical material is scattered or unsatisfactory in quantity. It is inevitable that medical education, as well as medical care, will require more and more in the way of expense.

Unfortunately too, while there is time saving through modern transportation, the automobile, the airplane and the telephone, the practice of modern medicine becomes increasingly expensive. For instance, to adopt just what has been done recently for our soldiers and sailors as a regular procedure for the whole of our civilian population in the way of preventive medicine, or in the way of care when either disease or wounds are present, would bring the costs of medical care in the United States to fantastic amounts. With our present thinking, what is tolerated in wartime in preventive medicine would be almost impossible to put through in peacetime among the whole population. Public thinking, public understanding is still at the "magic weed juice" level, if radio advertising is used as a measuring stick.

More equipment and, above all, a more highly trained personnel are now required in every medical center. There will need to be an increase in skilled trained nurses and laboratory technicians.

Particularly is this true in the field of physical medicine, which is now coming into its own. The human machine is a biologic instrument that has been played on by forces in the world environment over the whole period of human history. The effect of these forces, such as heat and cold, sunshine and shadow, led to adaptations that have carried man to all parts of the earth. The treatment of the sick has gone through periods when the applications of what we now call "physical medicine" have been widely and wisely used. With the new medicine that came out of the laboratory and the clinic, many of these therapeutic processes were largely forgotten. There is now a fortunate revival of the procedures of physical medicine at a time when the various rays show promise of giving material aid to the sick and when we are finding it possible to tag certain electrons so that we can follow their distribution throughout the body. This gives us hope that we can selectively treat with the various elements parts of the body that are subject to disease processes.

The social side of medicine is now the subject of a great national debate, for which the doctor has been ill prepared. His interest has been in the care of the sick. The congested premedical and medical course left little time for the study of economics or the so-called social sciences. The doctor's interest in the development of the hospital has been primarily that of a professional man seeking the best possible environment for those under his care.

The university hospital has been of great advantage to medical education. It is clear now that, since its work is thorough and often that of research, the university hospital, as we know it, cannot long survive on the income of invested funds. Free beds in the older hospitals often have to have a dozen or more endowments to support a patient for 365 days in the year. Support of hospitals used for teaching must come from prepaid hospital insurance or be government supported, by either the city, the county, the state or the national government.

The hospital or the clinic, as part of a medical center, must form the basis for clinical teaching. To keep medical education on that basis which has been so successful in the past, and to give it individual quality and permit experimentation and medical research, we must find a way to advance and support these medical centers without the profession and the educational institutions losing control of the organization of the staff and the training of the young physician.

The embryo doctor entering the field of medicine needs a brain and body of good durable quality. He must also have a strong sense of duty, a desire to help suffering human beings and to discover the truth—pleasant or unpleasant. He must have a good social sense, reliable moral character and high ideals of service, and he must believe in the human family as the unit of civilization. Each such medical student must make a study of his own qualities and his own interests. If we are to advance in some of the more difficult fields of medicine in the years ahead we must discover those who are capable of a life of research work, also those who find interest in administration and in psychiatry.

There has always been a certain number of those training in our medical schools who develop an interest in psychiatry. We now find ourselves under the necessity of identifying and increasing this number and of giving adequate training in a field of medicine which, while its practice is becoming more and more based on science, is still largely an art. In our advance in medical education we have done comparatively little for the large numbers of people who are to some degree held captives to society because of injury, disease or mental condition. The tens of thousands of patients that are now occupying or will soon occupy our veterans' hospitals, the mass of prisoners confined, often for long periods, in our jails and penitentiaries, the mentally deficient and the insane in our public institutions, the alcoholic and the drug addicts have been largely passed by in high types of medical care and in medical education. Up to a certain point it will be necessary for us to give about the same training to those students who are to enter the field of psychiatry as that of our other medical students; but there seems to be no good reason why we should give elaborate training in surgery and the various specialties at least during the latter part of their medical course and perhaps the intern period to such students.

Along with the training in psychiatry we must follow out a regular campaign to control and protect the insane, so that they will be handled from the standpoint of medicine rather than that of jurisprudence. When human beings begin to slip mentally their first contact should not be with the policeman but with the highly skilled staff of a mental institution, and at first on a voluntary basis. Our high speed civilization is full of perils and penalties. One of our present peculiarities is to try to increase materially the unoccupied or idle time of our fellow citizens. This has always struck me as an unwise procedure. It is just as unwise to have too much time to waste as it is to have too many hours of work. Sensible recreation is a matter of sound living. Uninhibited human beings in the presence of the emotional stimulation of such things as the theater, motion pictures and the races and with free access to alcohol and habit forming drugs will provide many unhappy patients for the psychiatrist, who will need to guide them to an adequate social adjustment.

In the look ahead, public health and governmental relationships to medicine of one kind or another are bound to become of increasing importance. Just how to discover those physicians who have administrative ability and who can deal with the public in preventive measures and who can keep the science of medicine in tune with the responsibilities of the individual and the family is going to be one of our most difficult tasks. Housing as it is developing in our larger centers is making the care of children and of the aged and infirm more and more difficult within the shelter of the family. For their care we shall need additional institutions with trained administrators and staffs. We are prolonging life by the control of infections and by more knowledge of nutrition, but our knowledge of geriatrics is in the infantile stage in comparison to what we should know. Journalists are asking every available centenarian to explain his ability to hang on to life so long and, as far as the newspaper reports go, he did so by some violation of what is ordinarily considered good hygiene.

We are finding peace as hard to take as was war. For centuries the physician has done his best work with the priest or the pastor at his side. Speed highways and speeded up machinery on the farm and in the factory make for instability of the nervous system. Science has made the doctor an invaluable if not an inevitable part of most phases of life. If the future doctor can combine science with the humanity, sympathy and understanding of the old family physician, much of the harshness and frustrations of what we now call civilization can be mitigated. Medical education can be molded with the needs of our fellow men if we can keep the profession alert to the preparation of those in training. We must act as a profession and not let medicine drift into the eager, frigid hands of the bureaucrat.

REACTIONS IN PENICILLIN THERAPY

LIEUTENANT MAXWELL H. KOLODNY
and
MAJOR ERIC DENHOFF
Medical Corps, Army of the United States

During the course of penicillin treatment of patients with cutaneous ulcerations, 2 developed generalized erythematous, maculopapular rashes. An exacerbation of the underlying dermatitis was observed in several other patients treated similarly. These reactions were at first thought to be due to impurities in the lot of penicillin or its diluent. It was found, however, that a group of syphilitic patients being treated with identical materials was showing no comparable reactions. Inquiry throughout the hospital revealed that, from time to time in various wards, medical officers had noted certain skin reactions during the course of penicillin therapy. The occurrence of these reactions, especially in patients in the dermatology wards, stimulated the present investigation.

There are many reports suggesting the occurrence of sensitivity to penicillin or to some associated impurity. Contact dermatitis[1] has been reported in persons engaged in its manufacture and in physicians and nurses handling the material. Cutaneous reactions[2] allergic reactions including urticaria,[3] asthmatic attacks[4] and a syndrome which clinically resembles serum sickness[5] have been described. In some general reports on penicillin therapy, references are made to similar reactions.[6]

SUBJECTS AND METHODS

A total of 124 patients, all young men, were observed for immediate and delayed reactions to parenteral administration of penicillin. Seventy-three were patients from the dermatology section and 51 were patients from the general medical and neurosyphilis sections. Of these, 46 dermatologic and 33 general medical or neurosyphilis patients were given penicillin specifically for the purposes of this study. They were given 20,000 units of the sodium salt in distilled water every three hours for eight doses totaling 160,000 units. The other patients were given various dosages of penicillin depending on the disease for which they were being treated. From all patients a detailed medical history was obtained concerning personal and familial allergies, previous skin diseases, drug intolerance, penicillin handling, previous penicillin therapy in any form and any reactions referable to it.

All the penicillin was administered intramuscularly. Records were kept of lot number and manufacturer. Many reactors were retested at varying intervals after the first reaction with either the same lot, a different lot or a different brand. Intradermal skin tests were performed, 250, 1,000 and 2,000 units being used per test dose (0.1 cc.). Skin tests with trichophytin 1:30 were performed concomitantly.

RESULTS

A total of 21 immediate and 11 delayed reactions were observed (tables 1 and 2). These were of several types.

Immediate Reactions.—It will be noted in table 1 that a greater number of immediate reactions occurred in patients with dermatologic disorders (25 per cent) than in patients of the general medical and neurosyphilis group (6 per cent). Eighteen of the 21 reactions were in patients with skin diseases, and in 17 of these exacerbation of a preexisting skin lesion with pruritus, hyperemia and exudation of serum was a prominent feature. Of this group 8 showed no other manifestations of a reaction.

The incidence of generalized rash, edema (periorbital and/or labial) and gastrointestinal reactions are also noted in table 1. In 4 patients an "id" reaction consisting of pruritus and vesiculation of the hands and feet, more intense in the interdigital webs, was seen. No immediate urticarial or febrile reactions were observed.

All reactions considered "immediate" appeared within twenty-four hours of the start of therapy; none appeared in less than ten hours. Further penicillin injections were discontinued in all but 3 cases on the appearance of a reaction. The reactions subsided within three to four days.

In 3 cases therapy was continued in spite of generalized erythematous eruptions. These subsided in four to five days without further untoward effects. Penicillin was not continued in cases in which generalized vesicular eruptions were present because of the possibility of precipitating exfoliative dermatitis.

The following illustrative case reports are presented:

Case 1.—A white soldier aged 25 first sought medical attention for dermatitis of the legs in December 1944 in New Guinea. It did not respond to local therapy. He was returned to a general hospital in the United States, where he was diagnosed as having severe "fungous" infection of the legs and feet. His past history was noncontributory, and routine laboratory examinations revealed no abnormalities. He was given local treatment with potassium permanganate soaks, boric acid compresses and salicylic ointment with progressive, satisfactory improvement.

Three months later he was given 160,000 units of penicillin intramuscularly over a period of twenty-four hours. About twelve hours after the first injection a rash was noted on the flexor surface of the left forearm. This spread rapidly over the abdomen, chest, back and shoulders. It was diffuse, finely papular, erythematous and pruritic. Within twenty-four hours it became finely vesicular. The vesiculation and pruritus were somewhat more accentuated in the groin and the areas previ-

ously involved by the dermatitis. At this time the patient's face had become moderately edematous.

The reaction subsided on the third day without therapy. The erythema faded and was followed by fine desquamation. There was no increase in eosinophilic leukocytes. Penicillin and trichophytin skin tests performed ten days later were strongly positive.

CASE 2.—A white man aged 34 who went to the Southwest Pacific Theater in November 1942 sought medical attention in December 1943 because of irritation in the popliteal region which was considered to be due to fungous infection. Local therapy produced only temporary relief. The patient continued to have periods of remissions and exacerbations, but eventually the dermatitis spread so that both legs were severely affected. Superimposed on the dermatitis were several dirty ulcers. He was returned to the United States in July 1945. Here he was found to have lichenoid lesions on both legs, with eczematoid dermatitis on the right leg and foot. He received potassium permanganate soaks and penicillin ointment. The ulcers healed satisfactorily, but the surrounding skin became irritated, and multiple small vesicles appeared in the areas where penicillin was applied. Penicillin was discontinued, and the vesiculation and irritation promptly subsided.

His past history was entirely noncontributory, and aside from the current illness he had never had skin disease or received penicillin in any form. In October 1945 he was started on 20,000 units of penicillin intramuscularly every three hours. Eleven hours after treatment was begun he developed periorbital edema, and within the next twelve hours there was so much swelling that he could barely open his eyes. No further therapy of any kind was given and the reaction subsided completely by the third day. One week later he was given a similar course of penicillin of another brand. A similar reaction was produced. A skin test with penicillin showed a moderate reaction; the trichophytin skin test was only weakly positive.

Delayed Reactions.—These occurred in approximately 7 per cent of the cases (table 2). There was no significant difference in incidence of reaction between the dermatologic and other groups. No asthmatic or febrile reactions were encountered. Two patients showed both immediate and delayed reactions.

The delayed reactions were quite consistent in time of onset and clinical course. With one exception all occurred within seven to fourteen days after the beginning of therapy; in this one exception severe symptoms developed twenty-three days after a course of 480,000 units of penicillin had been started for acute follicular tonsillitis.

The reactions varied in severity. All showed generalized urticaria with pruritus. In addition, 5 patients developed swelling of the small joints of the extremities, edema of the face (chiefly periorbital and labial), moderate lymphadenopathy, generalized arthralgia, myalgia and malaise. All reactions subsided within four to five days. In 1 case penicillin therapy was continued in spite of a generalized urticarial reaction. This subsided on the sixth day and did not reappear, although the penicillin was continued.

The following case reports are illustrative:

CASE 3.—A white man aged 43, a sergeant, who went to the Southwest Pacific Theater in September 1943, developed a treatment-resistant fungous infection of the hands in July 1945 and for this reason was returned to the United States.

He was admitted to this hospital in August 1945 and found to have an eczematoid dermatitis involving the dorsum of the right hand and left index finger. He responded well to local treatment. On September 24 penicillin ointment was applied for the first time. Within a few hours there was a prompt flare-up of the dermatitis characterized by hyperemia, swelling, pruritus and exudation of serum. This subsided promptly after the ointment was discontinued.

Aside from malaria and dermatitis, his past history was entirely noncontributory. He had never received parenteral penicillin therapy and, to the best of his knowledge, never had had any contact with it. On Oct. 19, 1945 he was given 20,000 units of penicillin intramuscularly every three hours. Shortly after the third injection he noticed generalized pruritus, nausea and flatulence. Within two hours a finely papular, erythematous rash appeared over the shoulders, the back, the chest, the abdomen and the flexor surfaces of the arms. The healing lesions of the preexisting dermatitis became hyperemic, pruritic and wet. Some vesiculation was noted along the margins. The patient was observed without further therapy of any kind and within four days the reaction had disappeared almost completely.

On October 23 he was given a similar course of penicillin, another brand being employed. Within sixteen hours a reaction similar to the previous one, although somewhat less accentuated, had developed. On the eighth day after the first course of therapy (October 26) giant urticaria of the face, flexor surfaces of the lower extremities and the buttocks appeared. This was associated with generalized pruritus. Epinephrine gave prompt but transient relief. Ephedrine afforded less satisfactory but more prolonged relief. Skin tests with penicillin and trichophytin were both strongly positive.

TABLE 1.—*Incidence of Immediate Reactions and Relationship to Underlying Disease*

Underlying Disease	Number Tested	Number Reacting	Exacerbation	Rash	Edema	"Id" Reactions	G. I. Symptoms

* The slightly higher incidence in the medical group is more apparent than real because in it are included 2 patients specifically chosen for study.

CASE 4.—A white man aged 33 was evacuated to the United States in June 1945 after twenty months in the Southwest Pacific area because of recurrent malaria. Aside from this illness his past history presented nothing unusual. He stated that he had received eight injections of penicillin for an abscess of the leg in July 1945. On October 10 the patient reported the presence of a penile lesion. Dark field examination revealed the presence of Treponema pallidum. Serologic tests for syphilis were negative. On October 13 intramuscular penicillin 40,000 units every three hours was started. A total of 2,400,000 units was administered. On October 20, the eighth day after starting therapy, a generalized urticarial eruption with pruritus developed. There was moderate swelling of the small joints of the extremities, some arthralgia, generalized myalgia, moderate lymphadenopathy and malaise. The temperature rose to 100.6 F.

but subsided after twenty-four hours. The patient complained of nausea and vomited three times. He was given epinephrine, ephedrine and barbiturates with relatively little relief. The reaction persisted for four days and subsided completely after six. There were no laboratory abnormalities aside from an eosinophilia of 11 per cent.

TABLE 3.—*Relationship of Immediate Reactions to Previous Penicillin Therapy*

	Dermatologic Patients		Nondermatologic Patients	
	Number Tested	Number Reacted	Number Tested	Number Reacted
No previous penicillin	23	5	24	2
Previous	50	13	27	1
Local	17	5	0	0

Both	13	2	0	0

TABLE 4.—*Relationship of Delayed Reactions to Previous Penicillin Therapy*

Previous Penicillin	Number of Patients Tested	Number of Patients Reacting	Average Time of Onset After Start, Days
None	47	5	10
	17	1	11
	47	5	10
Local and parenteral penicillin	13	0	..

Relationship to Previous Penicillin.—Tables 3 and 4 indicate that the incidence of immediate and delayed reactions to parenteral penicillin bear no significant relationship to the history of previous penicillin therapy, either local, parenteral or combined. Contact dermatitis was observed, however, following local application of penicillin in 4 men who had been treated previously by local penicillin in the same skin areas.

When the time factor between courses of penicillin was evaluated, it was found that the incidence of reactions was the same in the group with an interval of more than thirty days between courses as in the group with an interval of fifteen to thirty days (table 5).

Correlation with Previous Reactions and Significant Factors in Medical History.—A number of patients who had given a history of a reaction to penicillin one to six months previously did not react when tested at this hospital. Moreover, a number of patients who previously reacted while under observation here failed to do so when retested two to six weeks later, even with the same lot of penicillin. There were, however, a group of 12 men who reacted consistently on at least three occasions to each administration of penicillin, both from the history and under our observation.

TABLE 5.—*Relationship of Interval Between Previous and Current Penicillin and Reactions*

Interval	Number Tested	Number Reacting		Per Cent
		Immediate	Delayed	
15 to 30 days	35	5	4	25
More than 30 days	12	2	1	25

TABLE 6.—*Relationship of Interval Between Reactions*

Interval Between Tests	Reactors Retested	Reactions Recurred
More than 1 week	5	5
Less than 1 week	7	2

When these 12 known reactors were retested with the same lot of penicillin at varying intervals, it was found that reactions could be repeated with some degree of consistency only if an interval of more than one week elapsed between the courses (table 6). The groups are small, but the observations appear to indicate that possibly an anergic state of several days' duration follows an immediate reaction.

Patients who gave histories indicative of drug intolerance, penicillin handling, previous skin disease and personal and familial allergies had the same incidence of reaction as patients who had no such history.

Skin Tests.—Intradermal tests were performed on representative groups of reactors and nonreactors (controls). After preliminary titrations it was found that 1,000 to 2,000 units per test dose (0.1 cc.) was necessary to elicit a relatively consistent response. Concomitant skin tests were performed with trichophytin antigen 1 : 30.

Of 15 reactors tested, 11 developed unequivocally positive intradermal skin tests to penicillin. Nine had positive trichophytin skin tests; 8 of these were sensitive also to penicillin. Fourteen nonreactors were similarly tested. Of these only 2 were found to show a positive skin test to penicillin, and, in both, the reactions were noticeably less intense than those observed in the first group. Five patients showed skin reactions to trichophytin. Two of these were particularly strong, and in these patients the skin test for penicillin also was positive (table 7).

TABLE 7.—*Skin Tests*

Reaction to Previous Penicillin	Number Tested	Number Positive Penicillin Skin Test	Number Positive Trichophytin Skin Test	Number Positive Penicillin Only	Number Positive Trichophytin Only	Number Positive Penicillin and Trichophytin
Reactors	15	11	9	3	1	8
Nonreactors	14	2	5	1	4	2

The skin tests were all of the immediate type. I several cases reactions were either still present or mor evident after twenty-four hours. In 3 a large vesicl surrounded by an erythematous zone developed.

Conjunctival tests with penicillin of the same strengt were performed on most of the patients receiving penicillin skin tests. These were uniformly negative.

COMMENT

One of the interesting findings is the higher incidence of immediate reactions to penicillin in patients with skin diseases than in those with other illnesses. Of the various types of reactions, exacerbation of the skin lesions was most common, occurring in 17 of the 18 reactors. The nature of this reaction is not clear. These patients may manifest this type of response either because they already have skin disease or because their skin is a highly reactive shock organ. More probably the reaction in some of these patients may reflect a fungous infection, either past or present, with subsequent sensitization. The development of an "id" response in several of the patients and the more noticeable reactions in the groin and axillas in patients with a history of fungous infection in these areas would tend to substantiate this. It may be that the exacerbation is not unlike the reactivations occurring at the sites of old healed mycotic lesions following penicillin therapy.[7]

---

[7] Lamb, J. H.: Allergic Reactions During the Administration of Penicillin, Arch. Dermat. & Syph. 52:93 (Aug.) 1945.

A clearcut relationship between the antigenic substances common to some of the pathogenic fungi (hyphomycetes)[8] and antigens of Penicillium notatum (ascomycete) has not been demonstrated, but the clinical observations are suggestive. In this series the most severe reactions occurred in patients with fungous infection. It is also significant that the trichophytin skin test was positive in so high a proportion of patients sensitive to penicillin. It may be noted further that in the 2 patients with positive skin tests to penicillin from the nonreactor group the trichophytin skin test was strongly positive. The role of fungous infection or sensitization in the production of these reactions has not been clarified, but sufficient evidence has been presented to warrant further study.

Rashes which appeared within twenty-four hours occurred with equal frequency in the two groups of patients. These are not related to any underlying disease process or previous penicillin therapy. They may be an expression of an idiosyncrasy to the drug, perhaps in the nature of a dermatitis medicamentosa.

There seems to be little doubt that some of the reactions are allergic in nature. This is particularly true of the delayed reactions and of the immediate responses characterized by urticaria, angioneurotic edema and possibly gastrointestinal symptoms. The clinical manifestations are those of an allergic state; the time interval of seven to fourteen days necessary for its development and the immediate response in previously sensitized (treated) patients is characteristic. Moreover, relief by epinephrine and ephedrine is definite. Finally, Criep[3] has demonstrated antibodies by the precipitin test and Prausnitz-Kustner passive transfer reactions.

It is not known whether these reactions are due to the penicillin itself or to an impurity. If the latter, it must be common to the manufacture of many brands, since reactions do not follow a single lot or brand. Sensitization produced by one lot or brand was followed by a reaction on the administration of penicillin from another manufacturer. It is significant, however, that similar reactions have been produced by crystalline penicillin.[9] It is quite possible that the active principle, rather than the impurities, is to blame. The finding of Chow and McKee[10] that crystalline penicillin will combine with human albumin is noteworthy. If the penicillin-albumin complex is antigenic, or if the penicillin component acts as a hapten, it may afford a possible explanation for many of the allergic reactions. It may, at the same time, incriminate the active principle rather than the impurities.

SUMMARY

1. (*a*) The reactions encountered in 124 patients treated with sodium penicillin were studied.

(*b*) Approximately 16 per cent of the total number of patients showed immediate reactions. The incidence of reaction in dermatologic cases was 25 per cent as compared with 6 per cent in nondermatologic cases.

(*c*) Approximately 7 per cent of all patients showed delayed reactions. The incidence was the same in both dermatologic and nondermatologic groups.

2. No significant relationship was found between the incidence of reaction and previous penicillin therapy.

3. (*a*) Penicillin reactions did not recur consistently in all patients subsequently given additional therapy. Some patients reacted consistently; others did not.

(*b*) The time interval between courses of penicillin bore no relationship to the incidence of reactions in the whole group.

(*c*) In a group of consistent reactors, however, it was found that a phase of relative anergy existed for a period of about five to seven days.

4. There was no correlation between a past history of personal and familial allergies, previous skin disease, drug intolerance, previous penicillin therapy or reactions referable to it, and the incidence of reaction. Contact dermatitis followed the local use of penicillin for skin lesions in 4 patients.

5. Skin tests were performed. It was found that 1,000 to 2,000 units per dose (0.1 cc.) was necessary to produce consistent responses. Concomitantly performed trichophytin skin tests showed a high degree of correlation in positive reactors. Conjunctival tests with penicillin were uniformly negative.

URINARY INCONTINENCE IN FEMALE FROM ECTOPIC URETERAL ORIFICES

DAVID S. CRISTOL, M.D.
and
LAURENCE F. GREENE, M.D.
Rochester, Minn.

There is no accurate way to estimate the number of women suffering unnecessarily from urinary incontinence. That the urinary incontinence of a considerable number of such unfortunate persons results because the ureteral orifices are anomalously located, most urologists are certain. Urologists are equally certain that a cure awaits those patients once the condition is recognized. The crying needs are first for an awareness of all physicians of the possible cause of the incontinence and then for direction of these patients for treatment. We are presenting some facts which were derived from a review of 19 cases observed at the Mayo Clinic in the hope that, when this condition and its treatment are brought to the attention of physicians, more of these patients will receive proper care. Twelve of these cases have been reported previously by Crenshaw.[1]

The urinary incontinence which results from ectopic ureteral orifices presents a characteristic picture. Most frequently the patients are young women, unmarried and rather retiring. Most often they have interrupted their elementary education and those who have sought jobs usually have not remained employed in one location for any length of time. Many have had few social contacts with members of the opposite sex. Of the few who have married, several have been divorced. For as long as they can remember, they have found it necessary to protect their underclothes from a slow but constant seepage of urine. This annoyance has been present despite the fact that they have a normal desire to urinate and perform that function in a normal manner. These patients usually have sought relief from physicians and charlatans. Many have been told that they cannot be cured, but usually they have arrived at that conclusion themselves. Those who have been told that they will outgrow the condition eagerly look forward to old age. The least fortunate may become psychotic.

From the Section on Urology, Mayo Clinic.

[1] Crenshaw, J. L.: Ureter with Extravesical Orifice; Supernumerary Ureter Ending Blindly; Crossed Ureteral Ectopia; Stones in Extrapelvic Cystocele: Report of Eleven Cases, J Urol **43**: 82-101 (Jan.) 1940.

The awareness and treatment of this condition can secure a cure for persons in this unhappy group is no overstatement. These persons have an anomalous condition of the urinary tract which fortunately lends itself readily to operation and cure. They usually have duplication of the renal pelvis and ureter on one or both sides. The ureter from the upper renal segment empties distal to the external urinary sphincter in the urethra or vestibule of the vagina rather than in the bladder (fig. 1). Thus when the duplication is unilateral, while the bladder normally fills with urine which comes from the lower segment of the kidney in which the duplication occurs together with the urine coming from the kidney on the opposite side, and the patient gets a normal desire to void, still urine constantly seeps from the ectopic ureteral orifice.

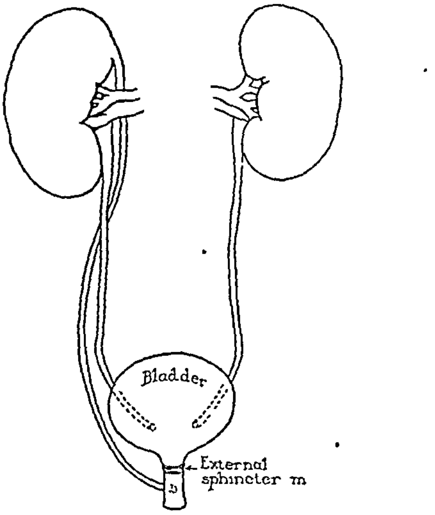

Fig. 1.—Diagrammatic sketch of the ectopic opening of the ureter leading from the upper segment of a duplicated kidney. The ureteral orifice is situated at a point distal to the external sphincter of the bladder

The diagnosis almost always can be made from the history alone. Any girl or woman who has dribbled urine constantly for as long as she can remember despite the fact that she normally has the desire to void and does urinate has an ectopic ureteral orifice or orifices. Further diagnostic evidence is obtained from the excretory urogram, in which duplication of the renal pelvis and ureter may be obvious or suggested.[2] In some cases the excretion of contrast medium by the upper renal segment, which usually is the seat of pyelonephritis, may not be sufficient to cast a shadow in the roentgenogram and hence only the lower renal segment will be visualized. In such a case the presence of duplication may be suggested by study of the size, shape and position of the lower pelvis which will be visualized in the excretory urogram. It will be noted that the upper calix of the lower pelvis, instead of extending superiorly, frequently, but not always, extends laterally and somewhat superiorly (fig. 2). Furthermore, the shadow of the pelvis will appear small as compared with the total renal mass, and considerable renal parenchyma with no pelvic outlet will be noted above the visualized renal pelvis. Although the upper renal segment cannot satisfactorily concentrate opaque medium, it will continue to secrete dilute urine.

Range of Ages of Patients Who Had Ectopic Ureteral Orifices

Age, Years	Cases
6 10	5
11 - 20	5
21 - 30	7
31 - 40	2

Still further confirmation occasionally can be obtained by location of the aberrant ureteral orifice. Too often this is impossible. However, the diagnosis is justified if the following are present: First, there must be the characteristic history, which was described previously, and secondly there should be urographic evidence of duplication of the renal pelvis and ureter with or without visualization of the upper segment. Only rarely will ureteral ectopia of this type be present when the renal pelvis and ureter are not duplicated.

The treatment is surgical and usually consists in heminephrectomy of the upper renal segment and partial ureterectomy. In the cases in which bilateral duplication is present and in which two aberrant ureteral orifices consequently may be present, the upper segments of both kidneys are removed. In such a case after the first heminephrectomy the leakage of urine is reduced but nevertheless persists until the other heminephrectomy is performed.

DATA COLLECTED FROM NINETEEN CASES OF ECTOPIC URETER

All the patients in this series were females, and their ages are given in the table Four patients had interrupted their elementary education. Two gave evidence of severe emotional instability. Of the 4 who had married, 2 were divorced shortly after the marriage. Only 1 patient had borne children. Many of these women had been employed in a succession of localities.

Fig. 2—Retrograde pyelogram. Typical appearance of lower segment of a duplicated kidney.

[2] Greene, L. F.: Duplication of the Renal Pelvis and Ureter, S. Clin. North America 24: 910 921 (Aug) 1944.

Every patient had dribbled urine since birth despite the fact that she also voided in a normal manner. Two patients also suffered periodic bouts of chills and fever. One patient did not suffer dribbling while recumbent. All the patients found it necessary to wear pads to prevent soiling their underclothes. Most of them had received previous medical examinations, and the usual diagnoses, in the order of their frequency, were weak sphincter, weak bladder, nervousness, urinary infection, behavior problem and vesicovaginal fistula.

In cases in which excretory urograms were made, the duplication was obvious in 8 and was suggested in 6 cases. Duplication was inferred from retrograde pyelographic studies of the lower pelvis in 4 cases; in 1 case duplication was absent. Successful retrograde pyelography of the upper renal segment was performed in 6 cases. The ectopic ureteral orifices were definitely located in 17 and doubtfully located in the other 2 cases. Seventeen patients remained for operation at the clinic. Unilateral heminephrectomy and partial ureterectomy were performed in 9 cases. Six of the operations were performed on the left side and 3 on the right. It was necessary to perform bilateral heminephrectomy and partial ureterectomy in 2 cases. These patients had bilateral duplication, and the ureteral orifices of both upper segments were ectopic. Bilateral duplication was evident in 3 more cases, but the ureteral orifice from only one of the upper renal segments was ectopic in each. The aberrant ureter was ligated in 2 cases; both patients subsequently developed cystic masses in the renal region. The ureter was transplanted into the bladder in 2 cases, and it was necessary to remove the entire kidney and ureter in 2 others. Without exception, all elements of renal and ureteral tissue removed revealed evidence of chronic inflammatory change. Chronic pyelonephritis, hydronephrosis and hydroureter were constant findings.

A careful search for evidence of other anomalies revealed none. Roentgenographic evidence of spina bifida occulta was found in 2 cases, but this can be considered to be coincidental. The mother of 1 patient also had unilateral duplicated kidney, but the orifices were situated normally.

COMMENT

Pleas for the early diagnosis of disease are frequently being made. Often these pleas concern diseases in which only a small percentage of cures is achieved even when the known treatments are given. We hope to stimulate the members of the medical profession to an awareness of this condition, which, when properly treated, can be corrected in every case.

Experimental Embryology of Mind.—A human spermatozoan is a tiny, free, human organism. Its behavior is determined by the manner in which its living protoplasmic system reacts to the chemical, mechanical and other energy relationships of its environment. It may be said that the movements of the sperm are chemotactic or rheotactic. When such a proper motile and mechanistically determined sperm fertilizes a proper human ovum in a suitable environment, processes start which sometimes lead to the development of a new and infinitely complex, but again freely moving, human organism. Certain of these organisms, so developed, at definite stages in their lives perceive, have emotions, reason, talk, build airplanes and tanks, and bomb other similarly constructed human organisms.—Carmichael, Leonard: The Experimental Embryology of Mind, in Twentieth Century Psychology, New York, Philosophical Library, 1946.

MELIOIDOSIS ON GUAM

LIEUTENANT COMMANDER GEORGE S. MIRICK, MC(S), U.S.N.R.
LIEUTENANT COMMANDER HARRY M. ZIMMERMAN, MC(S), U.S.N.R.
COMMANDER GEORGE D. MANER, MC(S), U.S.N.R.
and
COMMANDER ARTHUR A. HUMPHREY, MC(S), U.S.N.R.

During the months of July and August 1945, 2 fatal cases of melioidosis[1] were encountered in military personnel on the island of Guam. The diagnosis in each instance was made by postmortem examination and by the isolation of Pfeifferella whitmori from the pathologic lesions observed. This micro-organism is similar in many respects to Pfeifferella mallei, the causative agent of glanders, and the lesions of the two conditions are similar. The findings in the 2 cases of melioidosis reported here are thought to be of importance because of the recognized high mortality attending human infection with P. whitmori and because of the apparent rarity of the disease in the past.

Up to 1933 only 95 cases of this disease in man had been described in the literature,[2] with a mortality of 95 per cent. Thirty-eight of these cases were reported from Burma, 39 from the Federated Malay States, 10 from Indo-China, 1 from Ceylon and 7 from Siam or the Dutch East Indies. It is believed that the 2 cases described in the present communication are the first to have been recognized on Guam or any other of the islands of Micronesia, Polynesia or Melanesia. The clinical, pathologic and bacteriologic findings concerning these 2 patients are described.

REPORT OF CASES

CASE 1.—*History.*—F. S., CPhM, U. S. Navy, had been stationed continuously on Guam for about six months before onset. No history was obtained from the patient of exposure to rats or any other animals known to be infected. He first became sick on July 13, 1945 with the symptoms of chills and fever, headache, burning eyes and slight cough. On admission to Base Hospital number 18 on July 14 his temperature was 102.2 F. and, following a shaking chill, rose to 104 F. Physical examination at that time showed no abnormal findings except those of a prostrated man just recovering from a shaking chill The urine contained some albumin but was otherwise normal. There were 12,500 leukocytes per cubic millimeter of blood On the following day there were 10,000 leukocytes per cubic millimeter of blood, with 72 per cent polymorphonuclear neutrophils, of which 2 per cent were juvenile forms, 32 per cent banded forms and 40 per cent segmented forms; lymphocytes comprised 25 per cent and monocytes 1 per cent of the total number of leukocytes. No malarial parasites were found. The sputum was clear and frothy, and a film stained by Gram's method showed no micro-organisms of recognized pathogenicity. The patient experienced daily shaking chills, the temperature swinging between 100.5 and 105. F. but usually remaining above 103 F. The pulse was rapid, varying between 100 and 120 per minute. Respirations varied between 24 and 32 per minute. On July 17, the fifth day of illness, the patient developed

[2] Couture, E.: La melioidose, Rev. d'hyg. 57:190 (March) 1935.

hiccups and became cyanotic. Rales became apparent at this time at the base of the left lung. A roentgenogram of the chest showed "irregular small nodular infiltration scattered throughout both lung fields, especially the lower halves—no evidence of confluence or pleural reaction." On July 18 the patient's condition deteriorated rapidly and he died. A total of 200,000 units of *penicillin* was given by intramuscular injection during the last five days of life without apparent benefit.

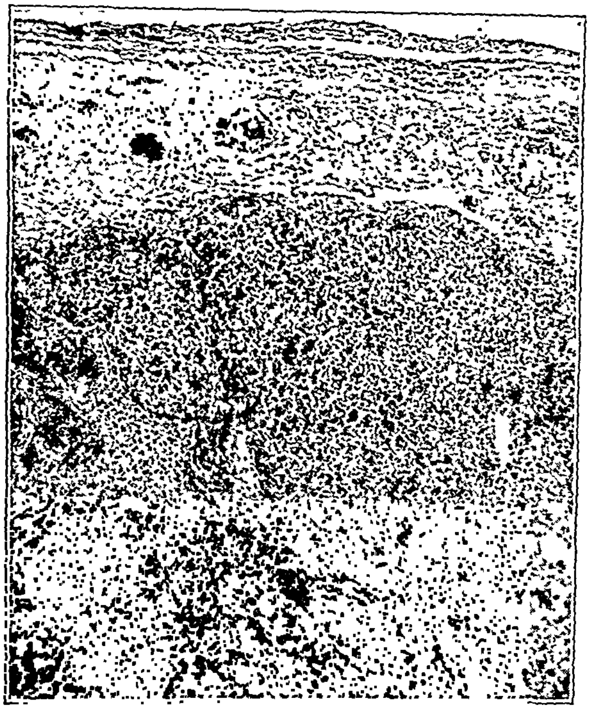

Fig. 1 (case 1).—Miliary abscess beneath relatively intact pleura. *All photomicrographs are at a magnification of 120 diameters and were made of microscopic preparations stained with hematoxylin and eosin.*

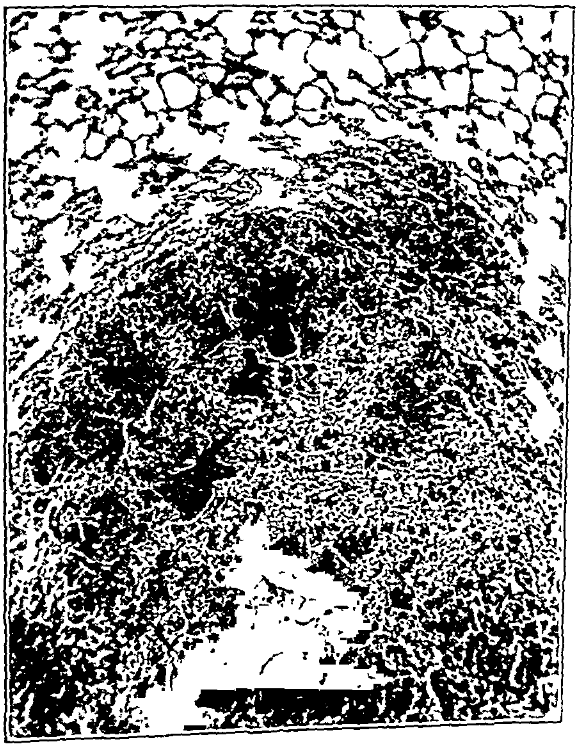

Fig. 2 (guinea pig 1).—Focal pulmonary abscesses with intervening organizing pneumonitis.

Pathologic Examination.—At necropsy the patient was *found* to have multiple small (*2 to 10 mm.*) gray, sharply defined abscesses, which had granulomatous margins and were filled with caseous pus. These abscesses were found throughout the lung, liver, spleen and kidneys and *in the mesenteric celiac* and cervical lymph nodes.

The histopathologic changes encountered in the different organs of the body were remarkably uniform, and a description of them in one organ suffices for all. The pulmonary lesions consisted of widely distributed miliary abscesses, often lying discretely beneath the pleura (*fig. 1*) *or more deeply in the* lung parenchyma and sometimes coalescing into large zones of suppuration. The intervening pulmonary tissue was the seat of an ordinary acute pneumonitis, *with* fibrin and neutrophilic leukocytes as the chief components of the exudate. Where the abscesses broke into the bronchioles the latter had their *mucosal epithelium desquamated and their lumens filled with* purulent material. The larger bronchi, and even *the trachea,* were partially ulcerated, and suppuration replaced parts of the mucosa and submucosa.

The *distinctive feature of the pulmonary infection, as it* was of the other viscera involved, was the granulomatous nature of the lesion. Except for the most acute miliary abscesses, the usual focus of infection had a definite wall of fibrin either partially or extensively organized (*figs. 3* and *4*) The "core" of the lesions was composed of *either liquefactive, coagulative* or caseous necrosis, sometimes one and sometimes another. These small granulomas were reminiscent of tubercles or of the lesions in glanders or tularemia, depending *on the type* of necrosis *and the* amount of organization by granulation tissue. *In the lungs,* where the pathologic process was most extensive, it had a certain resemblance to changes caused *by* actinomycosis

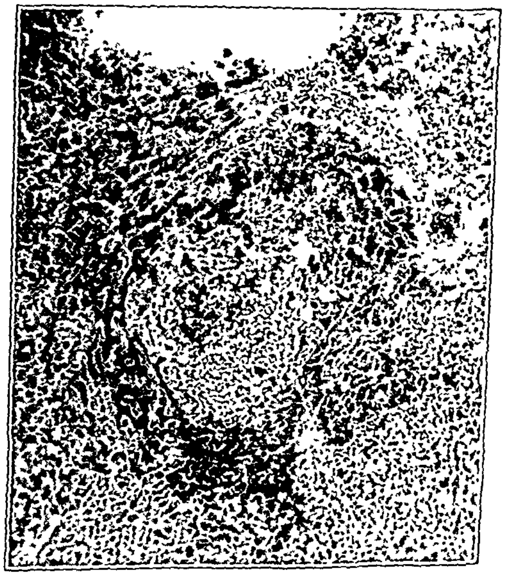

Fig. 3 (case 1)—Focal hepatic abscess. Note leukocytes in liver sinusoids.

Bacteriologic Examination.—Cultures were made from the lung; the predominant micro-organism was identified as Pfeifferella whitmori[1] by the following characteristics: It grew readily under aerobic conditions on all the usual culture *mediums, including* Koser's citrate medium. On nutrient agar containing 6 per cent human blood the colonies were round, low convex, translucent and grayish. The freshly isolated *strain produced* slight hemolysis after growth for twenty-four hours at 37 C.; this characteristic was not apparent on subculture. After growth for three days the colonies appeared grayish yellow. When grown for three days on tryptose phosphate agar (Bacto) a characteristic rough phase was observed. The bacterium grew readily in *broth, with the* formation of a pellicle. It was an actively motile, pleomorphic rod which was gram negative and showed characteristic bipolar staining. A small amount of acid but no gas was *formed* from the following sugars: glucose and galactose in two days, lactose, mannitol, xylose, maltose, sorbitol and *adonitol in* six days and sucrose in nine days; rhamnose, dulcitol and trehalose were not acidified in ten days. Gelatin showed stratified liquefaction to a depth of about 1 cm. below the surface after growth for three days at 22 C. The methyl red test and tests for the formation of hydrogen sulfide and indole were negative. Ammonia was produced from peptone. Nitrates were reduced actively to nitrites. Methylene blue was reduced, and catalase was produced.

Animal Inoculation.—An adult male guinea pig was injected intraperitoneally with 0.5 cc. of a 1 : 10,000 dilution of a twenty-four hour broth culture of this strain of P. whitmori in the rough phase. On the fourth day after inoculation the pig developed a typical Strauss reaction. The temperature became elevated to 105.4 F., and he refused to eat. He became progressively more wasted and on the ninth day developed diarrhea and a purulent discharge from the eyes. On this day the guinea pig was killed. At autopsy several sharply defined, slightly elevated firm gray areas 2 to 10 mm. in diameter were found on the lower surface of the liver and in the cortical substance of both kidneys. There were gray patches of consolidation in both the right and the left lung, particularly the lower lobes. The testes were enlarged, and there was a mass of caseous material surrounding both testes and seminal vesicles.

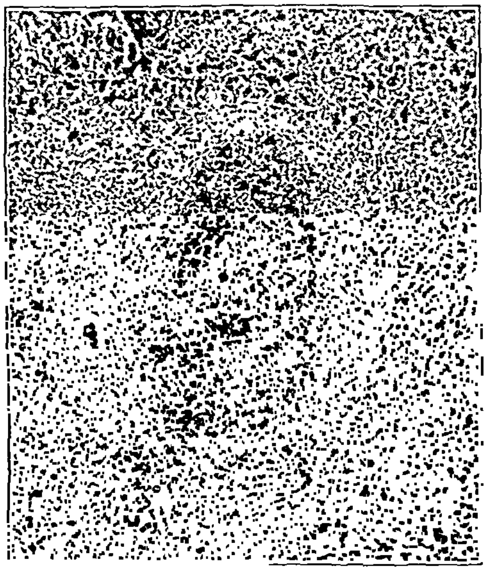

Fig. 4 (case 1).—Granuloma-like lesion in liver. Fibrosis on periphery of inflammatory response.

A film of this material when stained by Gram's method showed many polymorphonuclear leukocytes and large numbers of intracellular and extracellular bipolar gram negative rods, characteristic of *Pfeifferella whitmori*; a pure culture of the micro-organism in the smooth phase was recovered from the caseous material.

The histopathologic changes in this guinea pig are described later, with those found in the guinea pig injected with the strain of P. whitmori isolated from case 2.

Case 2.—*History.*—A. W. H., Pfc., U.S.M.C.R., arrived on Guam on Feb. 28, 1945 and was stationed with the 10th 155 mm. Gun Battalion of the 5th A. C. Many rats were present in the camp area, and the patient kept food in his tent in such a manner that it could have become contaminated by infected rats. There was no known direct exposure to any infected animals. He first became sick on August 2 with the symptoms of fever (103 to 105 F.), chilly sensations but no frank chill, headache, dull aching pain in the right lower quadrant of the abdomen and mild dyspnea. Physical examination was negative. The leukocyte count showed 8,500 cells per cubic millimeter of blood, with a normal distribution of types. The urine was normal. He was admitted to Fleet Hospital number 115 five days later, on August 7, and at that time had a temperature of 105.8 F., pulse rate 124 and respiratory rate 25. Physical examination was negative except for a hot dry skin, coated tongue and increased resistance and tenderness in the right lower quadrant of the abdomen. The lungs seemed normal at that time. There were 11,000 leukocytes per cubic millimeter of blood, with 75 per cent polymorphonuclear neutrophils, 3 per cent being banded and 72 per cent segmented forms, 3 per cent eosinophils, 18 per cent lymphocytes and 3 per cent monocytes. No malarial parasites were found. A culture of the patient's blood taken at that time was found three days later to contain a bacterium subsequently identified as P. whitmori. On August 8, the seventh day of illness, the patient's condition became worse, with the fever remaining high, pulse rate 150 per minute and shallow respirations of 32 per minute. Diarrhea with stools resembling pea soup became apparent. At that time the spleen was palpable and rales were noticed in the lungs. A roentgenogram of the chest showed diffuse bronchopneumonia. Treatment with penicillin was commenced, but the patient failed rapidly and died that evening, apparently of respiratory failure.

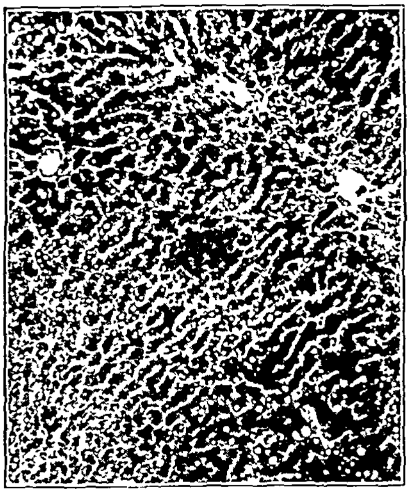

Fig. 5 (guinea pig 1).—Exceedingly small abscess in liver.

Pathologic Examination.—At necropsy there were found multiple small (1 to 5 mm.) abscesses which had definite walls and contained white pus. These were scattered over the surface (a few were deeply situated) of the liver, spleen, both kidneys and both lungs. In addition there was evidence of hypertrophic ileitis.

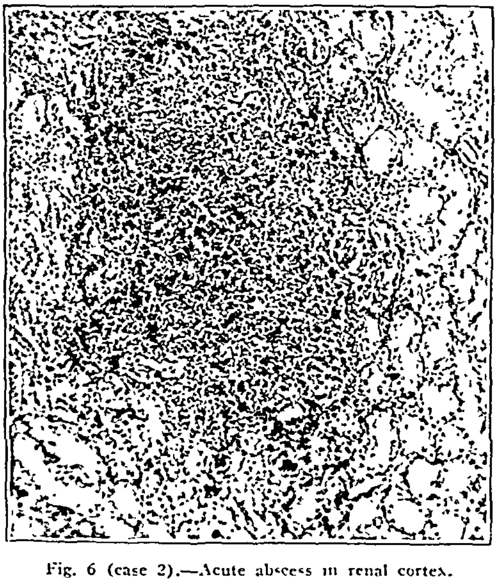

Fig. 6 (case 2).—Acute abscess in renal cortex.

The anatomic changes in the different viscera were strikingly similar; in addition, they were practically indistinguishable from those found in the first case. Acute miliary abscesses (fig. 6) as well as more chronic, tubercle-like granulomas were present in the lungs, liver, kidneys and spleen. In the ileum, where hypertrophic changes were in evidence, the mucosa was found to be free from ulceration. In the submucosa, however, there was an extensive lymphocytic and monocytic infiltration. The germinal follicles were numerous and large, and they displayed excessive cellular division.

Bacteriologic Examination.—A culture obtained from a liver abscess at the time of autopsy was subsequently identified as P. whitmori in the smooth phase. This strain was identical in almost all respects to that previously isolated in the first case and described in detail. Acid was formed from the same sugars and at approximately the same times, with the single exception of arabinose, which was not fermented in ten days by this strain. Moreover, all the other cultural and biochemical reactions which have been described were identical. Both rough and smooth phases of the micro-organism could be distinguished on plate cultures.

Animal Inoculation.—An adult male guinea pig was injected intraperitoneally with 0.5 cc. of a 1 : 10,000 dilution of a twenty-four hour broth culture of a smooth variant of this strain. A Strauss reaction developed on the second day after inoculation and the pig became febrile. It died on the sixth day after inoculation. At autopsy there were observed small (1 to 3 mm.), slightly elevated, firm, sharply defined, nodular abscesses on the surface of the liver and in the mesenteric lymph nodes. The lungs showed patchy gray areas of consolidation, particularly in the lower lobes. The spleen was enlarged, but neither the spleen nor the kidneys showed gross abscesses. Surrounding the testes were masses of gray caseous pus. A film of this material stained by Gram's method showed many polymorphonuclear leukocytes and many gram-negative bacilli with the characteristics of P. whitmori. The micro-organism was cultured from this material as well as from the lungs.

This guinea pig and the pig which was injected with the strain of P. whitmori isolated from the first case had similar histopathologic lesions. In most respects these lesions were also similar to those seen in the cases in man. The pulmonary changes (fig. 2) were much the same; there were focal abscesses with intervening organizing pneumonitis. The genesis of the suppurative lesions could be followed in almost any viscus, where were present the earliest miliary abscesses (fig. 5) as well as the most advanced, almost completely fibrosed granulomas (fig. 7). Of especial interest was the inflammatory response in the tunica vaginalis of the testis (fig. 8). There was much caseation here without either giant or epithelioid cell reaction. An extensive granulation tissue response occurred around some foci of coagulative necrosis, producing the picture of a nonspecific granuloma.

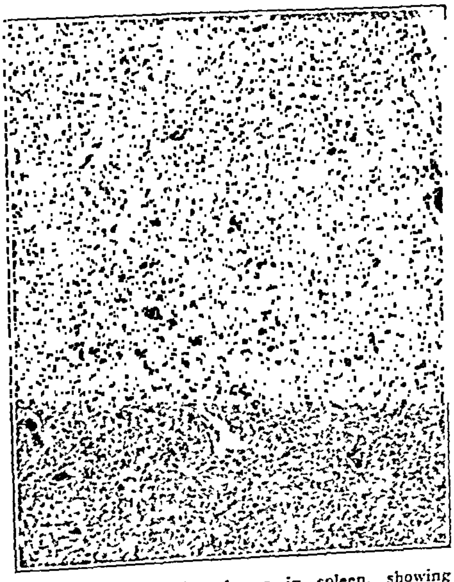

Fig. 7 (guinea pig 2).—Granulomas in spleen, showing advanced fibrosis.

COMMENT

The disease melioidosis affects not only human beings, but in Malaya, the Dutch East Indies and Ceylon it is known to attack animals, including rabbits, rats, cats, dogs and rarely horses. The disease may be given to susceptible animals by rubbing the causative organism on the intact skin as well as by the feeding or injection of infectious material. The infection in human beings is thought to occur usually through the ingestion of infected food or water. Blanc and Baltazard[3] have shown that the rat flea can harbor and allow the multiplication of P. whitmori They have also shown[4] that the mosquito Aedes egypti can become infected and transmit the disease by its bite, and they suggest that many arthropods may be capable of transmitting the infection.

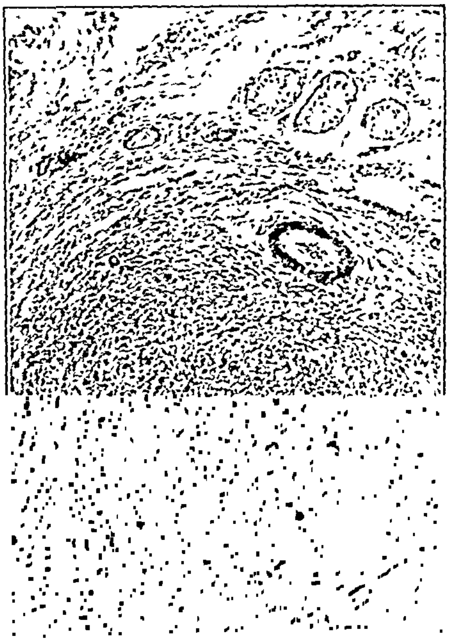

Fig. 8 (guinea pig 1).—Organizing abscess in tunica vaginalis.

There seems to be little doubt that the patients who are the subject of this report contracted melioidosis on Guam. The reservoir of infection on the island is at present unknown but is presumably one or both of the two species of rats (Rattus rattus and *Rattus exulans*) which infest the island. The possibility of infected dogs and cats must also be considered.

Melioidosis in human beings[2] usually takes the form, described in this report, of an acute or subacute septicemia with death resulting in three days to four weeks. A rare chronic form of the disease is also recognized in which large, sluggish abscesses may occur in any organ of the body and death is delayed for months or even years. No treatment for the disease has been known up to this time, but recently Grant and Barwell[5] have described a chronic case which was treated with various sulfonamide drugs, with indications of some clinical improvement.

Experiments in our laboratory showed that neither strain of P. whitmori isolated was inhibited in vitro by large amounts (35 units per cubic centimeter) of penicillin. However, both of our strains are quite susceptible in vitro to the bacteriostatic action of sulfadiazine. In tryptose phosphate broth (Bacto) the growth of an inoculum of about 1,000 cells was completely inhibited at eighteen hours at 37 C. by sodium sulfadiazine in a concentration of 15 micrograms per cubic centimeter of medium. This compares favorably with the susceptibility of pneumococci. Therefore it would seem appropriate that therapy with sulfadiazine or one of the allied sulfonamides be attempted in subsequent patients who are suspected of having melioidosis.

SUMMARY

The clinical, pathologic and bacteriologic findings in 2 fatal cases of melioidosis contracted on Guam were obtained. Studies in vitro showed that the two strains of the causative bacterium, Pfeifferella whitmori, isolated from the patients were not susceptible to the bacteriostatic action of penicillin but were very sensitive to sulfadiazine. These findings justify the clinical trial of the sulfonamide drugs in the treatment of this highly fatal disease.

ALKALIZATION OF URINE DURING SULFONAMIDE THERAPY

OTTO J. PENNA, M.D.
Resident in Surgery, Evanston Hospital

and

FREDERICK CHRISTOPHER, M.D.
Associate Professor of Surgery, Northwestern University Medical School; Chief Surgeon, Evanston Hospital

Evanston, Ill.

It has been known for some time that irreparable damage may be done to the kidneys by the crystallization of sulfonamides in the urine. Gilligan and his associates[1] and many others have shown the importance of adjuvant alkali therapy in the prevention of renal complications. Sulfonamides as well as acute infectious disease processes have an acidifying effect on the urine. Gilligan showed that 27 per cent of the total amount of sulfadiazine administered was crystallized in acid urine with a p_H of 5 to 6. Solubility of the crystals was twenty to thirty times greater when the p_H was 7.5 than when it was 5.0. Hence crystalluria can be reduced to a minimum if the urine is kept neutral or alkaline and if an adequate daily urinary excretion is maintained.[2] Schwartz and his associates[3] demonstrated that sulfadiazine produces less crystalluria than sulfathiazole (67.8 per cent of their patients who were given sulfathiazole without alkalization showed crystalluria, whereas only 25.3 per cent of those receiving sulfadiazine showed crystals). About one third of the sulfadiazine administered appears in the urine as the acetylated compound.[4] The solubility of sulfadiazine and of acetylsulfadiazine is more than doubled by increasing the p_H of a solution from 7 to 7.5.[5] Both sodium bicarbonate (12 to 22 Gm. daily) by mouth[6] and sodium r-lactate intravenously[7] have proved effective in keeping the urine sufficiently alkaline for prevention of sulfonamide crystalluria. Gilligan recommends 550 cc. of sixth molar sodium r-lactate twice daily. He considers this the equivalent of 15.4 Gm. of sodium bicarbonate orally. With a daily dosage of 1,100 cc. of sodium lactate, only 16 of 280 specimens collected from patients on sulfadiazine therapy showed crystalluria, and later specimens were clear after the administration of further alkali. The p_H value ranged from 7.0 to 8.5, and the urine remained alkaline for twenty-four to thirty-six hours after discontinuance of the alkali.

When oral administration of alkalis is impossible, parenteral alkalization of the urine is mandatory. Infectious conditions which are benefited by the sulfonamides often necessitate the maintenance of high levels of sulfonamide in the blood and rapid alkalization of the urine. To achieve this alkalization the intravenous route is preferable to the oral. Owing to faulty supervision of the administration of the sulfonamides, many cases of anuria have been caused by crystalluria. Such a condition is a true emergency, and part of the treatment consists in rapid alkalization of the urine.

Although sodium r-lactate has proved effective in alkalizing urine,[7] at least 1,000 cc. of the solution is needed each twenty-four hours. An effective alkali of less volume is preferable in certain cases in which there is need to restrict the fluid intake and yet supply an adequate amount of amino acids and glucose parenterally. Fifteen Gm. of sodium bicarbonate can be given in 200 cc. intravenously. It is evident that sodium bicarbonate administered intravenously is more effective than an equal amount given orally.

Only until rather recently have sterile solutions of sodium bicarbonate (free from sodium carbonate) been available for intravenous use. An ampule with 3.75 Gm. of sterile sodium bicarbonate in 50 cc. of water may be obtained commercially.[8] The p_H of this solution is 7.7; rarely the p_H is 8.0. (The normal p_H of blood is 7.5.) One liter of sixth molar sodium r-lactate has 3.82 Gm. of sodium. Fifteen Gm. of sodium bicarbonate in 200 cc. of water contains 4.08 Gm. of sodium.

Our purpose in the present study has been to determine the value of intravenous administration of sodium bicarbonate for alkalizing the urine.

PROCEDURE

A group of 12 uncomplicated postoperative cases were used to test the effectiveness of intravenous administration of sodium bicarbonate during sulfadiazine therapy. The patients were all physically fit males, ranging in age from 18 to 40 years, and had been hospitalized for either herniorrhaphy or excision of a pilonidal cyst.

Group 1 consisted of 6 patients who were given 6 Gm. of sulfadiazine orally each day for five days (2 Gm. initially and then 1 Gm. every four hours). These patients were given 3.75 Gm. of sodium bicarbonate in 50 cc. of water intravenously at 8 a. m. and 8 p. m. This regimen was started on the first postoperative day. The daily fluid intake was kept near 2,500 cc. All urinary specimens were tested before, during and after this five day period. Urinalysis, blood counts and determinations of the blood level of sulfadiazine and of the carbon dioxide combining power were made every second or third day. All patients were ambulatory by the third postoperative day. The 6 patients in group 2 were kept on the same routine except that they were given 7.5 Gm. of sodium bicarbonate in 100 cc. of water intravenously twice daily. Group 3 consisted of 2 patients who were closely studied to determine the rapidity with which the urine could be made alkaline. Nitrazine paper with a p_H range of 4.5 to 7.5 was used in testing all urinary specimens.

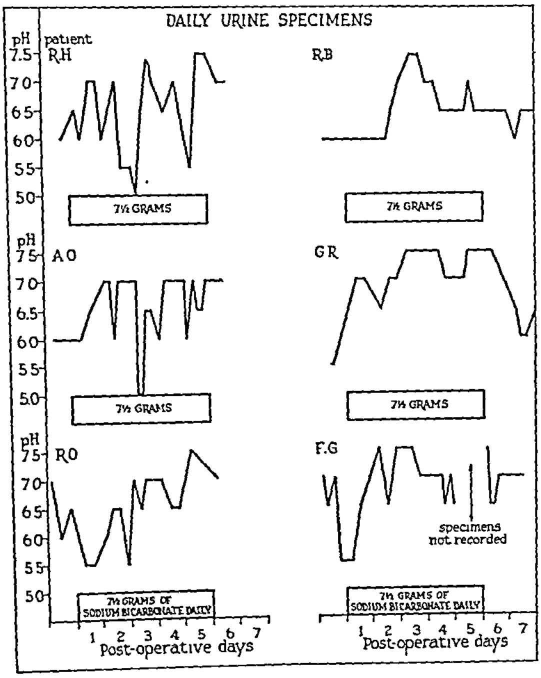

Chart 1.—Urinary specimens in group 1.

RESULTS

Group 1.—The 6 patients in this group received intravenously 3.75 Gm. of sodium bicarbonate in 50 cc. of water twice daily plus sulfadiazine orally. Microscopic urinalysis was done on the second and fourth days. Three patients were tested on the fifth day also. Morning specimens were used throughout for analyses. Two patients showed crystalluria. One patient (R. B.) showed many sulfadiazine crystals per high power field on the second day and a few crystals on the fifth day. The p_H of the urine varied from 6.0 to 7.5 during the five day period. The sulfadiazine level of the blood reached a high of 14.2 mg. per hundred cubic centimeters. Urinalysis was negative two days after the sulfadiazine was discontinued. Another patient (R. H.) had a few crystals per high power field on the fifth day. At that time the sulfadiazine level of the blood was 12.2 mg. per hundred cubic centimeters. Only 1 patient complained of any subjective symptoms; he noted tingling and numbness in the lower lip immediately after the injection of sodium bicarbonate. All determinations of the carbon dioxide combining power (done on the second and fifth days) were within normal limits, ranging from a low of 53 to a high of 63 volumes per cent. A total of 114 specimens of urine were collected from these 6 patients during the five day period. The p_H results are given in table 1. Chart 1 shows the p_H of the urinary specimens before, during and after the five day period of administration of sulfadiazine orally and of sodium bicarbonate intravenously (7.5 Gm. daily in 100 cc. of water).

Table 1.—*Results in Group 1*

p_H	Number of Specimens
4.5	0
5.0	3
5.5	7
6.0	13
6.5	27
7.0	41
7.5	23

Group 2.—A second group of 6 patients received 6 Gm. of sulfadiazine orally and 15 Gm. of sodium bicarbonate in 200 cc. of water intravenously each day. The same routine was followed as for group 1.

Table 2.—*Results in Group 2*

p_H	Number of Specimens
4.5	0
5.0	0
5.5	0
6.0	4
6.5	8
7.0	23
7.5	57

None of these patients showed crystalluria during the five day period. Morning specimens were examined microscopically every second day. The sulfadiazine level of the blood ranged from 6.6 to 8.9 mg. per hundred cubic centimeters. All determinations of the carbon dioxide combining power of the blood were between 48 and 61 volumes per cent. One patient had fever, but this disappeared after the sulfadiazine was stopped.

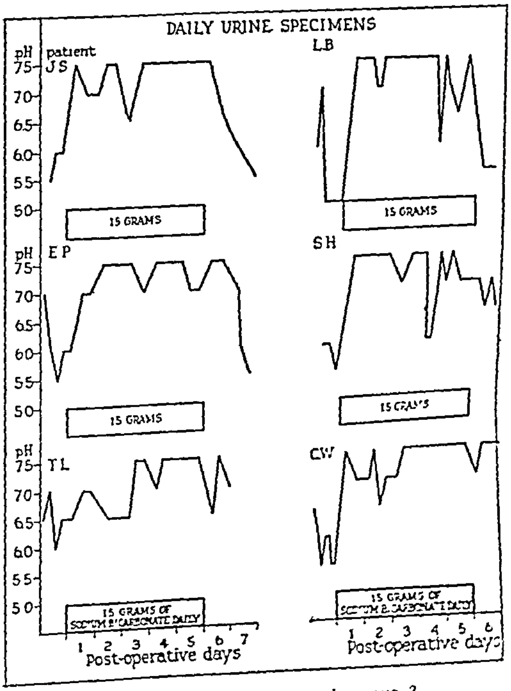

Chart 2.—Urinary specimens in group 2.

No infectious condition could be detected to explain this fever; the patient had no subjective complaints. In this group also 1 patient said that he noticed a temporary numbness in his lips immediately after 7.5 Gm. of sodium bicarbonate was injected. These injections were given over a three to five minute period. The p_H of 92 specimens tested varied from 6.0 to 7.5, as shown in table 2. The p_H of the urinary specimens in all these cases stayed at 6.5 or higher for at least twenty-four hours after the last injection of sodium bicarbonate. Chart 2 shows the p_H curve of the urinary specimens in this group.

Group 3.—This group consisted of 2 patients who were healthy young men. They were studied with regard to the rapidity with which the urine could be made alkaline. The first patient (R. H.) was told to void completely, and the p_H of the urine tested 6.0. He then drank 500 cc. of water, and 3.75 Gm. of sodium bicarbonate in 50 cc. of water was injected intravenously. Thirteen minutes later a voided specimen had a p_H of 6.5; thirty minutes later the p_H was 7.5. The initial specimen of the second patient (F. S.) tested 6.5. Then 7.5 Gm. of sodium bicarbonate in 100 cc. of water was injected intravenously. He complained of mild dizziness and dryness of the mouth that lasted for five minutes. Fifteen minutes after the alkali was given the urinary p_H was a strong 7.5 (maximum on the indicator scale).

SUMMARY

The effectiveness of intravenous administration of sodium bicarbonate in alkalization of urine during sulfadiazine therapy was tested. Six patients were given 3.75 Gm. of sodium bicarbonate in 50 cc. of water intravenously twice daily, and 6 were given 7.5 Gm. in 100 cc. of water twice daily. All patients received 6 Gm. of sulfadiazine daily. Specimens of urine were checked for p_H and crystalluria. Three of 15 specimens from patients in group 1 showed asymptomatic crystalluria. One hundred and fourteen specimens from patients who each received a total of 7.5 Gm. of sodium bicarbonate daily had a p_H range of 5.0 to 7.5. Fifty of these were acid. From patients receiving 15 Gm. of sodium bicarbonate daily (group 2) none of the 92 specimens studied showed crystalluria. The p_H ranged from 6.0 to 7.5. Only 12 specimens were acid. Two patients complained of numbness in the lips following injection of the alkali. All values for carbon dioxide combining power were well within normal limits. Two patients were studied with regard to the rapidity with which the urine could be made alkaline. One patient had a p_H change from 6.0 to 7.0 thirty minutes after he was given 3.75 Gm. of sodium bicarbonate in 50 cc. of water intravenously. A second patient was given 7.5 Gm. in 100 cc. of water intravenously, and his urine changed from a p_H of 6.5 to 7.5 in fifteen minutes.

CONCLUSIONS

1. Adults can be given sterile solutions of 7.5 Gm. of sodium bicarbonate in 100 cc. of water intravenously without ill effect.
2. Fifteen Gm. of sodium bicarbonate daily (given intravenously in two doses each of 7.5 Gm. in 100 cc. of water twelve hours apart) will keep the urine sufficiently alkaline to prevent sulfadiazine crystalluria in the average adult.
3. If 7.5 per cent solution of sodium bicarbonate is given intravenously, the same degree of alkalization can be obtained with one-fifth the volume of solution as is necessary when sixth molar sodium r-lactate is used.
4. The urine can be made alkaline within thirty minutes by intravenous injection of 7.5 Gm. of sodium bicarbonate in 100 cc. of water.
5. Intravenous administration of sodium bicarbonate solution should be helpful when it is desirable to build up a high level of sulfadiazine in the blood rapidly and simultaneously to render the urine alkaline.

ACTIVITY OF A NEW ANTIMALARIAL AGENT, CHLOROQUINE (SN 7618)

Statement Approved by the Board for Coordination of Malarial Studies

R. F. Loeb, M D, New York, Chairman; W. M. Clark, Ph D, Baltimore, Chairman, Panel on Biochemistry; G R. Coatney, Ph D, Bethesda, Md, U. S Public Health Service; Captain L. T. Carden.Jr., M D, Washington, D. C, Executive Secretary

An intensive exploration of the effects of SN 7618 on animals and man has been in progress during the past two years. This has included an evaluation of the activity of this compound in avian infections, a study of the pharmacology and toxicology in animals and man and finally of its potentialities as an antimalarial against vivax and falciparum infections in man. Included in the latter category are:

1. Extensive studies on its prophylactic activity against domestic and Southwest Pacific strains of vivax malaria, on its curative activity against sporozoite-induced infections when administered alone and in combination with other compounds, and its suppressive activity
2. Extensive investigations in service installations of the potentialities of this drug for use in the termination of the acute attack and in the suppression of the disease.

The pharmacology of SN 7618 has been examined in fairly extensive experiments with mice, rats, dogs, monkeys and man. Most of these studies have been made in comparison with quinacrine.

The following is a brief outline of the pertinent conclusions drawn from the overall investigation by various laboratories screening potential antimalarials in avian infections, studying the pharmacology and toxicology of potential antimalarials, various clinical units examining in man the prophylactic, suppressive and curative effects of potential antimalarials, and by the Army and Navy.

The investigations of the various laboratories and clinical units were sponsored by the Committee on Medical Research of the Office of Scientific Research and Development.

ABSORPTION, EXCRETION, TISSUE DISTRIBUTION AND DEGRADATION

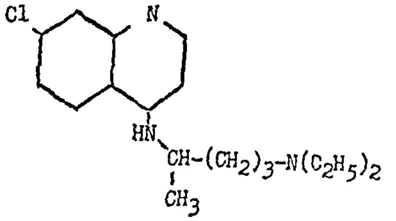
The absorption of SN 7618 from the gastrointestinal tract, like that of quinacrine, is complete or nearly complete. SN 7618 is absorbed somewhat more rapidly than quinacrine and, because of lesser localization, is present in substantially higher concentrations than quinacrine on any given dosage schedule. Excretion of SN 7618 is slow but is slightly more rapid than that of quinacrine. The urinary output of SN 7618 may be increased by acidification of the urine and decreased by alkalization.

Considerable amounts of SN 7618 are deposited in the organs and tissues, the quantities being proportional to the dose of drug. SN 7618 is concentrated in nucleated cells, especially those of the liver, spleen, kidneys and lung. These organs contain the highest concentrations, from 200 to 500 times the amount in plasma. The drug is also concentrated to a considerable extent in leukocytes. Brain and spinal cord contain the lowest concentration, no more than 10 to 25 times the amount in plasma. Thus, the general pattern of distribution of SN 7618 is similar to that of quinacrine.

SN 7618, like quinacrine, is metabolized in the body, only a small part of the drug administered being found in the excreta. Ten to 20 per cent is excreted unchanged in the urine and, as noted, the latter fraction can be increased by acidification of the urine. The definite localization of SN 7618 in the organs with the slow rate of excretion and degradation necessitates the administration of a priming dose if the desired concentration of drug in the plasma is to be rapidly reached and maintained. As in the case of quinacrine, these factors result in a slow disappearance of SN 7618 from the body when the dosage is discontinued; the concentration of the drug in the body fluids generally falls about 60 per cent per week when drug administration is stopped.

TOXICITY

There is little difference in the toxicity of SN 7618 and that of quinacrine in experimental animals. The acute oral toxicity of SN 7618 is about the same as that of quinacrine in the rat and monkey. The acute intravenous toxicity of SN 7618 is greater than that of quinacrine in the dog. Short-term chronic toxicity tests in the mouse show that the two drugs are about equally toxic. In such tests carried out in the rat and monkey for periods not exceeding thirty days SN 7618 is slightly more toxic than quinacrine. In longer term studies with the rat and monkey extending up to one hundred and twenty days the drugs are about equally toxic or, if anything, SN 7618 is slightly less toxic than quinacrine.



Chloroquine (SN 7618): 7-chloro-4 (4-diethylamino-1-methylbutylamino) quinoline.

In man, the symptoms which have been observed following doses of SN 7618 adequate for treatment of the acute attack include mild and transient headache, visual disturbances, pruritus and gastrointestinal complaints. In chronic toxicity studies in man using a dose (0.5 Gm. weekly) in excess of that necessary for adequate suppression, no serious symptoms and no impairment of health have been observed in 31 subjects over a period of eleven months of consecutive drug administration. In studying the record of about 5,000 individuals who have received SN 7618, every symptom which has been observed has been recorded in an effort to bring out even minimal toxic manifestations. In a small number of instances, usually with dosages higher than necessary for either treatment or suppression, individual subjects have refused to continue drug administration because of unpleasant symptoms. None of these manifestations has been constitutionally serious and all have been readily reversible. Unlike quinacrine, SN 7618 does not discolor the skin.

In a study of the chronic toxicity of SN 7618 on a dosage of 0.5 Gm. once a week, 1 patient in 31 after eight months developed a lichen planus-like eruption. This eruption subsided ten days after discontinuation of the drug.

ANTIMALARIAL ACTIVITY

SN 7618 is more active than quinacrine in all the avian malarias in which it has been tested. In cathemerium malaria both in the canary and in the duck it is 3.5 times as active as quinacrine. Different tests against gallinaceum malaria show it from 5 to 13 times as active as quinacrine. In lophurae malaria in the duck it is 2.5 times as active as quinacrine. Like quinacrine, SN 7618 does not produce permanent cures in any of these infections, nor is either drug prophylactic in sporozoite-induced cathemerium malaria in the canary or gallinaceum malaria in the chick.

SN 7618 is highly active against the erythrocytic forms of P. vivax and Plasmodium falciparum. It does not prevent relapses in vivax malaria even when administered in doses many times those required to terminate an acute attack, nor will it prevent the establishment of vivax infection when administered as a prophylactic. It is highly effective in vivax malaria as a suppressive agent and in the termination of acute attacks, significantly lengthening the interval between treatment and relapse beyond that observed with quinacrine or quinine. In falciparum malaria it has been demonstrated to suppress the acute attack and to effect complete cure of the infection. Studies of the antimalarial activity of SN 7618 against well standardized strains of P. vivax and P. falciparum have shown its activity to be approximately three times that of quinacrine. In well tolerated therapeutic doses a great majority of patients will be afebrile within twenty-four hours and the remainder within forty-eight hours. Thick smears for parasites will generally be negative at forty-eight to seventy-two hours.

RECOMMENDED DOSAGE REGIMENS

A. *In Suppression.*—Effective suppression of malaria with single weekly doses has been demonstrated. For suppressive therapy a dose of 0.3 Gm. given on the same day each week is recommended.

B. *In Treatment of the Acute Attack.*—An initial dose of 0.6 Gm. of SN 7618 followed by an additional 0.3 Gm. after six to eight hours and a single dose of 0.3 Gm. on each of two consecutive days is sufficient to produce prompt disappearance of symptoms and of parasitemia. This regimen eradicates infection due to P. falciparum and terminates the acute attack of P. vivax infection. In the latter, freedom from clinical attacks may be maintained thereafter by administration of suppressive doses as recommended. Satisfactory responses have also been reported following the administration of 1.2 Gm. in divided doses over a period of twenty-four hours.

Finance and Organization.—In the intellectual establishment of the country the alternatives now forced on government represent in essence a profound difference, the difference between central and distributed responsibility. Directly local authorities cease to exist and the thinking and the differences in thinking on which diversity of activity has depended are ceded to a central agent, a central government, to central authority instead, diversity dies.—Cohn, Alfred E.: Minerva's Progress, New York, Harcourt, Brace & Co., 1946.

Clinical Notes, Suggestions and New Instruments

DELAYED SENSITIZATION TO PENICILLIN SIMILAR TO SERUM SICKNESS

JOHN A. STRAZZA Jr., M.D.
Jersey City, N. J.

Many reactions to penicillin or to toxic impurities contained in individual batches of the extract have been described. Lyons[1] reported such reactions as chills, fever, headache, eosinophilia and other pathologic conditions. Keefer[2] reported urticaria. Other toxic manifestations have been thrombophlebitis,[3] gastrointestinal reaction,[4] contact dermatitis[5] and vesicular dermatitis.[6] Bullous dermatitis was reported by Morris and Downing.[7] Fortunately, none of these reactions were of such severity as to jeopardize the life of the patient. Several references call attention to occasional reactions simulating serum sickness. These reactions may be of such severity as to be alarming. Price, McNairy and White report 1 such case, resulting in severe asthma almost causing the death of their patient.[8] It is my purpose to report another case of delayed sensitization to penicillin of unusual severity.

P. G., a white man aged 23, a physician, was admitted to the Jersey City Medical Center on April 16, 1945 because of painful swelling of the right leg. Family and past histories revealed no evidence of allergic manifestations in the patient or in any close relatives. Physical examination was negative except for a red, tender, nonfluctuant area about 5 by 5 cm. over the upper one third of the posterior aspect of the right leg. Two large tender nodes were palpable in the right inguinal region. On May 18 the abscess was opened and a moderate amount of purulent material was expressed. Because of the cellulitis, penicillin was started on May 21 and continued through May 24, 20,000 units intramuscularly every three hours for a total of 500,000 units. It was noted during the administration of the penicillin that there was itching at the site of injection and flushing of the face. The temperature remained normal throughout the hospital course. Urinalysis was negative, the white blood cell count 7,300 with 70 per cent polymorphonuclear leukocytes, 25 per cent lymphocytes, 2 per cent monocytes and 3 per cent eosinophils. The patient was discharged on April 25, 1945 in good health.

He was readmitted on May 5 because of severe urticaria and pruritus beginning three days prior to admission. The patient attempted to treat himself with epinephrine. His pruritus became so severe that he was forced to use epinephrine in 0.5 cc. doses every half hour. One day prior to admission he noted urticaria on his buttocks. On the day of admission he noted painful swelling of the hands and feet. Examination revealed that he was acutely ill, thrashing around in bed and exhausted from lack of sleep and continuous motion. There was swelling of the face, hands and feet. Large areas of urticaria were noted on the buttocks and back. The uvula was edematous. There was intense pain on motion of the hands and feet. Walking was difficult as a result of pain. There were generalized bleeding scratch marks on the skin. The heart and lungs were normal, the temperature was 99 F., the pulse rate 96 and the respiratory rate 22 per minute. The urine showed a faint trace of albumin. The white blood cell count was 9,300, with 80 per cent polymorphonuclear leukocytes, 18 per cent lymphocytes and 2 per cent eosinophils. The blood Wassermann reaction was negative. Blood sugar and nonprotein nitrogen determination were within normal limits.

Epinephrine in oil 7 minims (0.4 cc.) was given every four hours as needed. This produced temporary relief lasting about one hour. Linit starch baths three times daily also gave short lasting relief of one to one and one-half hours. Calcium gluconate given intravenously was ineffective. Twelve hours following admission the patient became very weak and faint. His pulse was rapid and of poor quality. He was put in the Trendelenburg position. Four hours later he became very restless and complained bitterly of pain in his hands and fingers, headache and dyspnea. Epinephrine was given with relief of symptoms. Insomnia continued in spite of phenobarbital ½ grain (0.032 Gm.) given three times a day and sodium pentobarbital 1½ grains given at night. Thirty hours following admission urticaria was very severe on the face, especially around the chin and mouth. The patient complained of increasing dyspnea and difficulty in swallowing solid foods. Examination revealed edema of the pharynx with considerable swelling of the uvula. Epinephrine 7 minims and one hour later ephedrine sulfate ⅜ grain (0.024 Gm.) and phenobarbital ½ grain (0.032 Gm.) were given with definite relief of symptoms. Forty-eight hours after admission he complained of severe stiff neck. This again was relieved by administration of epinephrine in oil. On the third hospital day, seventy-two hours after admission, the patient's symptoms suddenly subsided. He was discharged on May 13, 1945, asymptomatic.

It is estimated that in the three days prior to admission to the hospital the patient administered approximately 130 minims (6 cc.) of epinephrine to himself. While hospitalized, he received a total of 52 minims (3.1 cc.). A scratch test performed with penicillin of the same manufacturer and same lot as that originally used on the patient in concentration of 15,000 units per cubic centimeter gave a negative result.

Whether the sensitizing agent in this case was the active principle of penicillin or other substances in commercial penicillin capable of producing sensitization is not known. If the former is true, then in spite of the fact that refinements in manufacture will free penicillin from more and more foreign substances, these severe and all too alarming reactions will continue to occur occasionally and therefore must be anticipated.

Jersey City Medical Center.

POSITIVE URINE METHYLENE BLUE TEST IN AMEBIC HEPATITIS

LIEUTENANT COMMANDER SIDNEY E. CHAPIN (MC), U.S.N.R.

It was with the greatest interest that the experiences of Myers[1] and Gellis and Stokes[2] with the methylene blue test for bilirubin in urine were received on the Pacific island on which I was stationed. As fortune would have it, however, my associates and I instituted the test as a routine procedure too late to use it as a diagnostic aid in infectious hepatitis. On the other hand, the test did prove an aid in cases already under treatment, and the experience here was the same as that described by Gellis and Stokes. In determining the course of the disease and the occurrence of relapses, of which we saw a few, the test was accurate.

Then we got a positive test in a case of amebic hepatitis which we feel is noteworthy.

REPORT OF CASE

A Marine aged 21 was admitted to the medical service on September 10 with a diagnosis of catarrhal fever (the usual admission diagnosis of most of our cases of infectious hepatitis

---

From U. S. Fleet Hospital 115, F. P. O., San Francisco.

This article has been released for publication by the Division of Publications of the Bureau of Medicine and Surgery of the U. S. Navy. The opinions and views set forth in this article are those of the writer and are not to be considered as reflecting the policies of the Navy Department.

[1] Myers, C. P.: Use of Methylene Blue in Testing for Bilirubin in Urine, J. Indust. Hyg. & Toxicol. **27:** 52 (Feb.) 1945.

[2] Gellis, S. S., and Stokes, Joseph, Jr.: The Methylene Blue Test in Infectious (Epidemic) Hepatitis, J. A. M. A. **128:** 782 (July 14) 1945.

in the months when the admissions were many and the test was not available). For five days he had had chilly sensations, general malaise, pain in the right side of the chest, some ill defined shoulder pain on the right and a low grade fever. Because of limited expansion of the right side of the chest and diminished breath sounds at the base of the right lung the patient's battalion surgeon had carried him on a diagnosis of bronchopneumonia until a negative x-ray was procured.

At the division hospital, the day before admission to this hospital, it was noted that the area of liver dulness had increased and there was pronounced tenderness and muscle spasm in the right upper quadrant. The icterus index was 5.5, the sedimentation rate 30 mm. per hour, the leukocyte count 12,000 and the differential normal.

On admission to this fleet hospital the history was essentially the same except for the additional facts elicited of an intermittent diarrhea of six weeks' duration (blood and mucus not noted) and a complete anorexia for the past few days. Before admission the patient was given large doses of sulfadiazine for three days without effect on the course of the illness. He was well developed and fairly well nourished, showed evidence of recent loss of weight, was nonicteric and appeared acutely ill. The lag of the right side of the chest and pain on deep inspiration were very obvious. The temperature was 100.6 F., the pulse rate 84 and regular, and the respiratory rate 20. The upper respiratory tract was clear, the heart was normal, and breath sounds were diminished at the right base with slightly increased fremitus but no rales and no bronchial breathing. The liver was palpable 1½ inches below the costal margin, it was exquisitely tender, and there was some voluntary spasm of the upper right rectus muscle. Pressure against the lower end of the bony cage of the chest elicited considerable tenderness. The remainder of the abdomen was normal, and the remainder of the examination was negative.

A routine urinalysis on admission was negative except for considerable bile and a strongly positive test with methylene blue. The blood count revealed 70 per cent hemoglobin (Tallqvist), 3.65 million red cells and 9,900 white cells, with a differential count of 84 per cent polymorphonuclears, 24 per cent lymphocytes and 2 per cent eosinophils. X-ray examination showed an elevated right diaphragm with compression of the right lower lobe. A stool specimen revealed large numbers of Endameba histolytica. The icterus index was 12.5.

Because of the anorexia, the positive methylene blue test, the prodromes, the enlarged liver and the fact that the patient came from an organization where infectious hepatitis had occurred previously, a diagnosis of infectious hepatitis was entertained on admission. However, the history of diarrhea and the exquisite liver tenderness prompted the stool examination, which was positive for amebas.

Treatment with emetine and carbarsone, choline chloride, a high protein diet and multivitamin tablets was instituted immediately. The patient's temperature remained normal after twenty-four hours. After the fourth dose of emetine the liver tenderness had diminished, and on the fifth day after admission the methylene blue test of the urine became negative. The patient's appetite was excellent after the second hospital day.

Three weeks after admission the patient was evacuated to a rear area with a liver that was no longer palpable and appeared normal on x-ray examination. The patient was apparently making an uneventful recovery from the hepatitis.

COMMENT

Methylene blue tests were done here on the urine from patients taking atabrine, 1 patient with cirrhosis of the liver and 2 patients in the orthopedic service with massive tissue hemorrhages. All the tests were negative. This was done in an attempt to find other conditions that might influence the test.

We realize that we are not contributing anything to the controversy, mainly chemical, that this test has set off. We cannot help feeling, however, that the test is not an indication of the presence of bilirubin but rather of a substance, as yet unidentified, which is excreted in the urine when the liver is acutely inflamed.

It is felt that this test is valuable in pointing the attention of the examiner to the liver. Done routinely in acute disease, so many cases of which have a similar onset, it would help to sort out cases of the type reported here in which specific therapy might have been instituted days before.

SUMMARY AND CONCLUSION

1. In a case of amebic hepatitis the methylene blue test of the urine was positive until specific therapy with emetine was instituted, after which the test became negative.
2. This test is of value in pointing the diagnostic finger toward the liver in acute inflammatory conditions of that organ.
3. The methylene blue test of the urine is a simple procedure which can be done without so-called laboratory facilities. It is urged that it be adopted as part of all routine urinalyses.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

AUSTIN SMITH, M.D., *Secretary.*

TUAMINE.—Racemic 2-aminoheptane.—Racemic β-aminoheptane.—$C_7H_{17}N$.—M. W. 115.22. The structural formula of 2-aminoheptane is:

$$\begin{array}{ccccccccccccc} & & H & & H & & H & & H & & H & & \\ H_3C & - & C & - & C & - & C & - & C & - & C & - & CH_3 \\ & & H & & H & & H & & H & & NH_2 & & \end{array}$$

Actions and Uses.—Tuamine produces vasoconstrictive action and is a member of the group of compounds known as sympathomimetic amines. Inhalation of the vapors provides an effective method of treatment for acute rhinologic conditions and is of added usefulness when prolonged and repeated medication is necessary (*see also general monograph on sympathomimetic amines*). It should be used with caution by those who have cardiovascular disease. It is made available in an "inhaler" type of device.

Dosage.—One or two gentle inhalations through each nostril, repeated at hourly intervals if needed.

Tests and Standards.—

Tuamine occurs as a colorless to pale yellow liquid which boils within the range *138.5-142.5 C. It is sparingly soluble in water* but freely soluble in ether, ethanol, chloroform and benzene.

At 25 C tuamine exhibits a *refractive index of from* 1.4150 to 1.4200, a specific gravity of from *0.7600* to *0.7660* and a vapor pressure of *approximately 4.8 mm* of mercury. *The pH of a 1 per* cent solution of tuamine is 11.45.

Dissolve 1 cc. of tuamine and 1 Gm. of potassium cyanate *in 25 cc* of distilled water to which 5 cc. of 10 per cent sulfuric acid has been added. Warm the solution on a steam *bath for one hour*, cool, filter, wash with distilled water and dry the crystals at *100 C*: the product melts at *127-129 C.*

Transfer about 1 cc. of tuamine to a tared weighing bottle and weigh it accurately. *Evaporate the* tuamine on a *steam bath to con*stant weight: the nonvolatile residue does not exceed 0.2 per cent. Dissolve 1 cc. of tuamine in *10 cc. of liquid petrolatum, U. S. P. XII*: no turbidity is produced.

Weigh accurately about 1 Gm. of tuamine and *dissolve it in 25 cc.* of half normal sulfuric acid. Titrate the excess acid with *half normal* sodium hydroxide, using methyl red as the indicator. *Each cubic centi*meter of half-normal sulfuric acid is equivalent to 0.0576 Gm. of tuamine: the tuamine content is not less than *99.0 per cent.*

ELI LILLY & CO., *INDIANAPOLIS*

Tuamine Inhaler: *Each* inhaler *contains* at the time of *packing 2-aminoheptane* carbonate, equivalent to 325 mg. of 2-aminoheptane, menthol, 32 mg. and ylang ylang oil, 65 mg.

Tuamine Inhaler.—

Transfer the contents of *the inhaler to an ammonia distillation* flask and rinse the container with water, adding the washings to the flask. Add 3 cc. of *40 per* cent sodium *hydroxide and distil* the amine into 35 cc. of tenth normal hydrochloric acid. Complete the determination as directed under tuamine. Each cubic *centimeter of tenth normal* hydrochloric acid is equivalent to 0.01152 Gm. of tuamine: the amount of tuamine found is not less than 95 per cent *nor more than 105 per* cent of the amount claimed to be present at the time of packaging.

EPHEDRINE HYDROCHLORIDE (See New and Nonofficial Remedies, 1945, p. 283).

The following additional dosage form has been accepted:

ABBOTT LABORATORIES, NORTH CHICAGO, ILL.

***Solution* Ephedrine Hydrochloride 5% and Procaine Hydrochloride 1%:** 2 cc. ampuls.

HOSPITAL SERVICE IN THE UNITED STATES

TWENTY-FIFTH ANNUAL PRESENTATION OF HOSPITAL DATA BY THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS OF THE AMERICAN MEDICAL ASSOCIATION

F. H. Arestad, M.D., and M. G. Westmoreland, M.D.

TABLE OF CONTENTS

HOSPITAL DATA, STATISTICAL TABLES AND TEXT.................................PAGES 1073-1085
INTERNSHIPS AND RESIDENCIES..PAGES 1086-1090
LIST OF REGISTERED HOSPITALS..PAGES 1091-1150
APPROVED SCHOOLS FOR OCCUPATIONAL THERAPISTS, PHYSICAL THERAPY TECHNICIANS, CLINICAL LABORATORY TECHNICIANS, MEDICAL RECORD LIBRARIANS AND X-RAY TECHNICIANS..PAGES 1151-1161

In the present report on Hospital Service in the United States it will be found in comparison with 1944 that the number of hospital beds has increased from 1,729,945 to 1,738,944, the number of admissions from 16,036,848 to 16,257,402, the number of patient days from 475,607,484 to 512,915,155 and the number of hospital births from 1,919,976 to 1,969,667. These and other items of special interest are contained in the following report, which includes (1) a compilation of information and statistics on hospital service including number, size and classification of hospitals, bed capacity, patients admitted, births, average daily census, hospital days, average length of stay and percentage occupancy; (2) special tables with detailed information on hospitals in each state, classified by control and type of service; (3) a study of nursing personnel, schools of nursing education and technical personnel; (4) a discussion on necropsy performance in approved internship hospitals; (5) a report on internships and residencies in specialties; (6) a list of residencies in specialties approved by the Council and the respective specialty boards since Sept. 29, 1945, when the latest list of Approved Residencies and Fellowships was published in The Journal; (7) a complete list of hospitals registered by the American Medical Association with symbols designating hospitals approved for internships and residencies, hospitals standardized by the American College of Surgeons and schools of nursing accredited by the respective states, and (8) lists and other information regarding technical schools approved by the American Medical Association.

SUMMARY OF HOSPITAL DATA—1945

All Registered Hospitals	
Number	6,511
Bed capacity	1,738,944
Bassinets	83,131
Patients admitted	16,257,402
Births	1,969,667

Hospitals applying for registration 101

The lists and statistical data presented in this report were compiled directly from information received from individual institutions. As in previous years, the hospitals submitted their reports on annual census blanks representing a combined hospital questionnaire prepared by the American Medical Association and the American College of Surgeons. This uniform procedure, inaugurated six years ago, has been welcomed by hospital administrators everywhere as it conserves time and effort and helps to eliminate unnecessary duplication in the preparation of hospital reports. The present survey began in October 1945, each hospital having been requested to supply information for the twelve month period which ended September 30. Excellent cooperation was received, as evidenced by replies from nearly 98 per cent of the registered hospitals. Over 99 per cent of the hospitals approved for internships and residencies in specialties furnished reports to the Council.

The information published annually in the Hospital Number of The Journal has become increasingly valuable in the study and evaluation of hospital facilities in the United States. The present report is presented as a service to the medical profession and to all institutions, organizations and agencies concerned with hospital activities and allied functions. It should prove a valuable source of reference in connection with state surveys and other studies now being carried out in relation to pending hospital legislation. The Council on Medical Education and Hospitals wishes to extend its sincere appreciation to the military and government officials, hospital administrators and other personnel whose generous cooperation has made possible the completion of the present survey.

SCOPE OF HOSPITAL SURVEY

Represented in the report for 1945 are 6,511 hospitals registered by the American Medical Association, including 1,156 hospitals approved for internships and residencies and 2,625 accredited by the American College of Surgeons as meeting unconditionally its minimum requirements for general standardization. The hospitals of the Army, Navy, U. S. Public Health Service, Veterans Administration and other federal agencies are also represented in the tabulation, although it was not possible at this time to include all of these institutions in the published list. It may be anticipated therefore, that totals derived from the list itself may not be identical with the total hospital service illustrated in tables 1 and 2 of the statistical report. The present survey was likewise extended to the hospitals in Alaska, Canal Zone, Hawaii, Puerto Rico, and Virgin Islands. These will be found in the registered list but do not appear in the tabular report, which pertains only to hospital facilities located within the continental limits of the United States.

Summary of Growth of Hospitals, 1909 to 1945

	Federal Hospitals		State Hospitals		All Other Hospitals		Total	
Year	Number	Capacity	Number	Capacity	Number	Capacity	Number	Capacity

NUMBER, SIZE AND CLASSIFICATION OF HOSPITALS

The number of hospitals included in this study totals 6,511 or 100 less than reported in 1944. There was a net loss of 79 in the governmental classification and a decrease of 30 in the proprietary group. The nonprofit organizations, however, had a net gain of 9. The greatest change was in the federal institutions, where the general hospitals were reduced from 707 to 609. Variations in other divisions may be noted in tables 1 and 2 showing hospitals classified by control and type of service and also in the summary table, which combines the service classification and the agencies concerned. Since the publication of the Hospital Number, March 31, 1945, a total of 86 new institutions have been admitted to the Hospital Register whereas 186 have been closed or transferred to the unclassified file. Applications under consideration at the present time total 101. These are now being reviewed in accordance with the standards of the Council outlined in the Essentials of a Registered Hospital.

There is a group of 496 hospitals which, according to information received, do not fulfil the present requirements for registration. Their capacity is relatively small, however, totaling only 16,172 or less than 1 per cent of the beds reported in all hospitals. Certain other facilities are also omitted from the Register such as clinics, emergency stations and offices which occasionally provide a limited number of beds for temporary or emergency care.

Summary of Hospital Service Classified by Control

	Hospitals	Beds	Average Census	Bassinets	Births	Admissions

Total all hospitals	6,511	1,738,944	1,405,247	83,131	1,969,667	16,257,402

Information regarding the size of hospitals has previously been published in THE JOURNAL, March 30, 1935, March 11, 1939, March 30, 1940 and March 31, 1945. In the present report a table has again been included on the size of general hospitals, nervous and mental institutions, tuberculosis sanatoriums and other hospital services. In addition it should be noted that the 4,135 nonfederal general hospitals included in this report may be classified in the following manner: below 25 beds 1,005, 26-50 beds 981, 51-100 beds 911, 101-200 beds 714, 201-300 beds 273 and over 300 beds 251.

On the basis of ownership or control the registered hospitals may be divided into two major classifications —governmental and nongovernmental hospitals. The first, comprising 2,183 institutions, consists of 705 federal hospitals, 549 state, 508 county, 359 municipal and 62 under city-county control. The nongovernmental hospitals, 4,328 in all, may likewise be divided into two groups, the nonprofit organizations and the proprietary hospitals. The latter include 987 individual and partnership hospitals and 351 corporations unrestricted as to profit while the nonprofit organizations, a group of 2,990, represent 1,036 church related hospitals and 1,954 other nonprofit associations.

Summary of Hospital Data According to Type of Service

Type	Hospitals	Beds	Average Census	Bassinets	Births	Admissions
General	4,744	922,549	665,105	78,919	1,907,772	15,228,270
N & M	563	657,393	624,349	295	1,190	218,876
Tuberculosis	449	78,774	59,767	54	79	86,186

E.E.N.T.	42	2,664	1,615	8	.....	105,531
Children's	44	4,770	3,495	81	.....	90,097
Orthopedic	83	6,679	4,781	19	.....	29,151
Isolation	63	8,406	3,223	87	29	99,599
Conv. and rest.	102	9,556	7,009	32	9	87,285
Institutions	168	17,720	11,093	32	135	112,211
All other hospitals	111	21,814	19,222	40	4	61,621
Total all hospitals	6,511	1,738,944	1,405,247	83,131	1,969,667	16,257,402

Twelve separate groups are included in the classification of hospitals according to type of service. The three principal divisions are the general hospitals, 4,744 in number, the nervous and mental institutions, 563, and the tuberculosis sanatoriums, 449. The remaining groups, totaling 755 institutions, may be listed as follows: maternity hospitals 106, industrial 36, eye, ear, nose and throat 42, children's 44, orthopedic 83, isolation 63, convalescent and rest 102, institutional 168 and other types 111. Of the general hospitals 3,521 are nongovernmental whereas 1,223 are in the governmental classification including 609 federal general hospitals.

Number of Hospitals According to Size

Bed Capacity	General Hospitals	Nervous and Mental	Tuberculosis	Other Hospitals	Total Number
Below 25	1,024	31	27	153	1,235
26 50	1,050	80	81	220	1,431
51 100	992	65	121	195	1,373
101 200	808	43	100	115	1,066
201 300	340	28	47	38	453
Over 300	530	316	73	34	953
Totals	4,744	563	449	755	6,511

BED CAPACITY

The hospitals registered by the Council have a combined capacity of 1,738,944 beds exclusive of 83,131 bassinets. Although a number of hospitals were discontinued in 1945 the development or expansion of other services resulted in a net increase of 8,999 beds. This may be compared with the average annual gain of 26,000 beds from 1909 to 1940, the increase of 80,691 in 1944 and the rapid wartime expansion of 265,427 in 1943.

Both the governmental and the nongovernmental hospitals showed a slight increase in bed capacity last year, the governmental group reporting 1,356,718 or 78 per cent of all beds, the nongovernmental hospitals 382,226 or 22 per cent. The federal hospitals which expanded rapidly during the war, had a net loss of 4,751 beds in comparison with the 1944 report. The county hospitals remained practically at their previous level, reporting a loss of only 423 beds, whereas the municipal institutions had a reduction of 2,322. The principal change in governmental classification occurred in the state group, which showed an increased capacity of 10,617. The hospitals under joint city and county control had a more limited gain of 1,319 beds In the nongovernmental hospitals the increase was 4,559 beds, 2,572 in the nonprofit associations and 1,987 in the proprietary group.

Governmental and Nongovernmental Hospital Service

	Hospitals	Beds	Average Census	Bassinets	Births	Admissions

Tuberculosis	131	11,584	8,934	1	4	15,579
Special	445	30,511	22,249	3,216	52,960	399,540
Institutions	26	1,384	721		1	12,907
Total nongovernmental	4,328	382,226	290,833	66,545	1,654,518	9,858,289
Total all hospitals	6,511	1,738,944	1,405,247	83,131	1,969,667	16 257,402

In the present survey the general hospitals reported 922,549 beds as compared with 925,818 in 1944. This represents a net decrease of 3,269 whereas the previous year showed an increase of 75,242. With their present facilities the general hospitals have 53 per cent of all beds. If classified by control it will be found that the governmental general hospitals have 601,266 beds or 34.6 per cent while the nongovernmental general hospitals have 321,283 or 18 4 per cent. The federal group, it should be noted, has 476,075 general hospital beds in a total capacity of 546,384. The mental institutions have 37.7 per cent of all beds having increased their capacity from 648,745 in 1944 to the present total of 657,393. Of this number 639,929 beds are located in hospitals operating under governmental supervision, particularly state control. The tuberculosis sanatoriums have 78,774 beds, a reduction of 1,074 as compared with the previous year. These facilities, however, do not include the tuberculosis beds available in connection with general and other hospital services. The three major divisions of general, mental and tuberculosis hospitals have 95 3 per cent of all registered hospital beds. The capacity of other groups may be noted in the tabular data presented in this report.

NUMBER OF PATIENTS ADMITTED

The tremendous task which confronts hospitals each year is clearly illustrated in the present report of 16,257,402 admissions exclusive of outpatients and newborn infants. This is equivalent to 12.3 per cent of the total population according to the U. S. Census of 1940, and may also be represented as 1 admission every 1.9 seconds. Since 1935 the admissions in the hospitals registered by the American Medical Association have more than doubled in number. The greatest annual gain occurred in 1943 when an increase of 2,829,088 was reported. The following year showed an increase of 662,150 while the present survey indicates a net gain of 220,554 in comparison with 1944.

The governmental hospitals with 78 per cent of the bed capacity reported 6,399,113 admissions or 39 per cent of the patients admitted in 1945. Nongovernmental hospitals, which received 61 per cent, had 9,858,289. Both groups showed a substantial increase in hospital admissions in 1944 but in the present survey the governmental hospitals showed a net loss of 146,107 as compared with the previous year. This reduction was limited to the federal group, which had a total decrease of 239,322 whereas the other governmental classifications showed an increase of 93,215. Gains in hospital admissions were reported in all nongovernmental groups including 179,109 in the church related institutions, 149,664 in the other nonprofit associations,

The general hospitals supply the greatest volume of hospital service in the United States. Last year they admitted 15,228,270 patients—93.6 per cent of all admissions—and maintained an average daily patient load of 665.105, in addition giving care to 1,907,772 newborn infants, or 96.8 per cent of all live births reported in the registered hospitals in 1945. Nongovernmental general hospitals had a total of 9,371,874 admissions, the federal general hospitals 3,898,995 and the other governmental general hospitals 1,957,401. Increases in general hospital admissions were reported in all governmental and nongovernmental classifications except in the federal hospitals and in the unrestricted corporation group. In this connection it may be noted that the governmental general hospitals have 34.6 per cent of the hospital beds and 36 per cent of the total admissions, while the corresponding figures for the nongovernmental general hospitals are 18.4 and 57.6 respectively.

The mental hospitals with 37.7 per cent of all beds had 248,876 admissions or only 1.5 per cent of the total patients admitted in 1945. Of this number 190,487 were received in governmental hospitals including 134,231 in state institutions. In comparison with 1944 there was an increased number of mental patients admitted in all nongovernmental groups. The mental hospitals under state, county and municipal control

TABLE 2.—HOSPITAL FACILITIES BY STATES AND BY TYPE OF SERVICE (Continued on next page)

showed a slight decrease, but the federal division reported an increase of 13,147. The total gain in relation to the previous year was 22,483. In measuring the volume of service in mental hospitals it is necessary also to take into consideration the average daily census or patient load. Last year, for example, the mental hospitals gave daily care to 624,349 patients, a total far in excess of the annual number of admissions in these institutions.

The tuberculosis sanatoriums show a continued decrease in the number of patients admitted as evidenced by the present report of 86,186 admissions as compared with 88,281 in 1944. Increases occurred in the federal, municipal and city-county classifications but reductions in other divisions resulted in a net loss of 2,095. Other special hospitals reported gains in both the governmental and nongovernmental groups, but services classified as departments of institutions showed a considerable reduction in hospital admissions last year. Comparative data in relation to previous years will be found in tables 1 and 2.

AVERAGE DAILY CENSUS

The enormous volume of service rendered by hospitals in the United States is likewise reflected in the daily patient load, which averaged 1,405,247 in 1945 exclusive of newborn infants. This average, which exceeds any previous report, represents the unprecedented total of 512,915,155 treatment days. For the first time also the daily census in general hospitals exceeded the patient load of the mental institutions, the latter reporting an average of 624,349 as compared with 665,105 in the general hospital section. In the previous year the corresponding figures were 618,951 and 570,331 respectively. All general hospital groups had an increased daily census except the institutions classified as corporations unrestricted as to profit. Gains were relatively small in most units, but the federal general hospitals reported an increase of 78,494 in comparison with 1944. It may be noted that the nongovernmental general hospitals had an average daily census of 244,245, the federal general hospitals 333,137, and the other governmental general hospitals 87,723. The number of treatment days in the general hospital group was 242,763,325 or 47.3 per cent of the total patient days in all registered hospitals.

The average patient load in the mental hospitals showed a net increase of 5,398 in 1945. Most of this gain occurred in the federal group although slight increases were also noted in the state, city-county, and proprietary classifications. With 44.4 per cent of the total hospital census the mental institutions had 227,887,385 treatment days including 193,922,310 in state hospitals and 28,605,415 in other governmental groups. The tuberculosis sanatoriums had a daily average of 59,767 patients as compared with 63,025 in 1944. Reductions occurred in both governmental and nongovernmental groups, but there were individual increases of 390 in the federal hospitals and 39 in the sanatoriums operated under individual or partnership control. Other special hospitals reported a combined census of 44,933, an increase of 13,693 in comparison with the previous year. Hospital departments of institutions, however, showed a net decrease of 4,834. The governmental hospitals with 78 per cent of the beds and 39 per cent of the admissions have 79.3 per cent of the total daily patient load. In the nongovernmental group the church and other nonprofit hospitals have an average of 258,251 or 18.4 per cent of the daily census in all hospitals. The corresponding figures for the proprietary group are 32,582 and 2.3 per cent.

PERCENTAGE OF BEDS OCCUPIED

The accompanying table on average occupancy rates in hospitals classified by control and type of service gives comparative data for 1942, 1944 and 1945. In the present survey increased bed occupancy was noted in all governmental groups except the state and county institutions which remained at their previous levels of 93.7 and 75.9 per cent, respectively. The municipal hospitals increased from 72.1 to 72.9 and the city-county institutions from 66.7 to 69.3. The most striking change was in the federal classification, however, where the utilization of hospital beds advanced from an average of 55.1 per cent in 1944 to 71.7 in 1945. As a group the governmental hospitals showed an occupancy rate of 82.1 as compared with 75.1 per cent in the previous year. In 1944, it should be noted, decreased rates occurred in all governmental divisions except in the state institutions where over 90 per cent of the beds are devoted to psychiatric care.

Percentage of Beds Occupied

	1942	1944	1945
According to Ownership or Control:			
Federal	66 6	55.1	71.7
State	93.4	93.7	93.7
County	77.7	75.9	75.9
City	76.9	72.1	72.9
City-county	70.5	66.7	69.3
Total governmental	84.5	75.1	82.1
Church	74.9	79.6	81.6
Nonprofit associations	74.5	73.8	75.4
Total nonprofit	74.7	76.1	77.9
Individual and partnership	56 1	62.2	57.7
Corporations (profit unrestricted)	65.3	74.1	73.0
Total proprietary	69.4	67.5	63.9
Total nongovernmental	72.7	75.0	76.0
According to Type of Service:			
General	68.2	61.6	72.0
Nervous and mental	94.4	95.4	94.9
Tuberculosis	85.0	78.9	75.8
Maternity	70.7	66.0	66 1
Industrial	55.5	61.8	62.3
Eye, ear, nose and throat	54.9	55.3	69.6
Children's	67.4	69.4	73.2
	75.4	68.1	71.5
	33.2	34.5	38.3
	82.1	57.8	73.3
Hospital departments of institutions	66.4	65.0	62.6
All other hospitals	81.1	88.5	88.1
Total all hospitals	81.4	75.1	80.8

The average occupancy in nongovernmental hospitals increased from 75 to 76 per cent. Both the proprietary and the nonprofit organizations showed an increase in the previous report, but in the present survey the expansion of occupancy rates was limited to the latter group. The church related hospitals increased from 79.6 to 81.6 per cent, the other nonprofit associations from 73.8 to 75.4.

In the general hospitals, the percentage occupancy advanced from 61.6 to 72.0, paralleling the expansion of the federal group, where increased occupancy rates were related mainly to general hospital beds. A continued decrease was noted in the tuberculosis sanatoriums and there was also a slight decrease in the nervous and mental group. Increased rates, however, were observed in the maternity, industrial, eye, ear, nose and throat, children's, orthopedic, isolation and convalescent and rest hospitals. The lowest rate, 38.3 per cent, occurred in the isolation hospitals, where bed reserves are usually maintained in relation to seasonal needs. For the total hospital group the average occupancy was 80.8 per cent as compared with 75.1 in 1944. This new rate approaches the level of 1942 when 81.4 per cent was reported.

In the study of percentage occupancy it is also of interest to consider the actual utilization of hospital beds in direct relation to population. For this purpose the accompanying table has been prepared showing the number and utilization of hospital beds in the United States per 1,000 population. Using the data obtained in the present survey and the population estimate of the U. S. Census Bureau, July 1, 1945 (total population, excluding armed forces overseas) it was found that for the period represented in this report the registered hospitals in the United States had 13.2 beds per 1,000 population. These were distributed as follows: general hospitals 7 beds per 1,000, nervous and mental institutions 5, tuberculosis sanatoriums 0.6 and other hospitals 0.6. The actual utilization of hospital beds, however, as determined in relation to the average daily census was 10.6 beds per 1,000 population, 5 in the general hospitals, 4.7 in the mental institutions, 0.4 in the tuberculosis sanatoriums and 0.4 in other groups.

Supply and Utilization of Hospital Beds in the United States per 1,000 Population *

1945

Type	Number of Hospitals	Number of Beds	Beds per 1,000 Population	Average Daily Census	Average Daily Bed Occupancy per 1,000 Population
General	4,744	922,549	7.0	665,105	5.0
Nervous and mental	563	657,393	5.0	624,349	4.7
Tuberculosis	449	78,774	0.6	59,767	0.4
Other hospitals	755	80,228	0.6	56,026	0.4
Totals	6,511	1,738,944	13.2	1,405,247	10.6
(Nonfederal general hospitals)	(4,135)	(446,474)	(3.5)	(331,963)	(2.6)

* Population estimates (U. S. Census Bureau) July 1, 1945: Nonfederal general hospitals compared with estimated civilian population; other groups compared with estimated total population, excluding armed forces overseas.

In the general hospital group it should be noted that the federal institutions have over half of the beds and more than 50 per cent of the daily patient load. Taking only the nonfederal general hospitals, therefore, and comparing their bed capacity and daily average with the estimated civilian population (U. S. Census Bureau, July 1, 1945) a ratio of 3.5 beds per 1,000 has been found with the actual daily utilization of 2.6.

AVERAGE LENGTH OF STAY

Comparative data for 1943, 1944 and 1945 have been included in the table showing average length of stay per patient in general hospitals. In the governmental group it will be noted that slight reductions occurred in the proprietary and church hospitals, while the other nonprofit associations remained at the level of the previous two years. A more noticeable change will be found in the governmental classification where the average stay increased from 20.3 to 26.2 days. Here the city-county institutions are involved to some extent but the principal advance is in the federal group where a sharp increase could be anticipated with the return of the wounded for longer periods of hospitalization. The general hospitals as a group show an increase of two days in the average length of stay as compared with 1944.

BIRTHS IN HOSPITALS

The use of hospital facilities for maternity care reached its highest point in 1945, when 1,969,667 live births were reported in the hospitals registered by the American Medical Association. The previous high was 1,924,591 in 1943. Last year the increase in hospital births was 49,691 whereas the previous year showed a decrease of 4,615. In 1942 and 1943, however, increases of 265,659 and 253,992 were reported. The accompanying table classified by control and type of service gives comparative data for the last three years and illustrates also the total increase in hospital births since 1929. In the twelve month period represented in this report, the hospital birth rate may be regarded as the equivalent of 1 live baby every 16 seconds.

Average Length of Stay per Patient in General Hospitals, 1943, 1944 and 1945

	1943	1944	1945
According to Ownership or Control:			
Federal	20.3 days	22.0 days	31.1 days
State	18.1 days	18.4 days	18.7 days
County	19.5 days	19.2 days	19.1 days
City	14.9 days	14.5 days	14.4 days
City-county	11.5 days	10.9 days	13.4 days
All governmental general	19.0 days	20.3 days	26.2 days
Church	9.7 days	9.7 days	9.6 days
Other nonprofit associations	9.9 days	9.9 days	9.9 days
All nonprofit general	9.8 days	9.8 days	9.8 days
Individual and partnership	6.9 days	6.9 days	6.6 days
Corporations (profit unrestricted)	8.3 days	8.6 days	7.8 days
All proprietary general	7.5 days	7.6 days	7.1 days
All nongovernmental general	9.5 days	9.6 days	9.5 days
All general hospitals	13.4 days	13.9 days	15.9 days

The governmental hospitals reported 315,149 births in 1945, the church related hospitals 665,153, the other nonprofit associations 793,220 and the proprietary institutions 196,145. The comparative figures for 1944 were 293,424, 652,761, 773,489 and 200,302 respectively. Thus it will be seen that a reduction occurred in the proprietary group, which involved both the individual and partnership hospitals and the corporations unrestricted as to profit. The total increase in the governmental hospitals was 21,725 including 14,175 in the federal group. The nongovernmental hospitals

Births in Hospitals According to Ownership or Control and According to Type of Service

	1929	1943	1944	1945
According to Ownership or Control:				
Federal	2,206	29,934	47,699	61,874

Total nongovernmental	538,355	1,650,900	1,626,552	1,654,518
According to Type of Service:				
General	566,177	1,856,204	1,856,650	1,897,772
Maternity	53,019	66,192	61,351	69,115
Children's	862	......	......	......
	277	172	152	175
	1,561	2,023	1,823	1,315
Total births in all hospitals	621,896	1,924,591	1,919,976	1,969,667

with a total of 1,654,518 newborn infants had 84 per cent of the hospital births, the governmental institutions 16 per cent.

In the classification of hospitals according to type of service it is noted that the births in general hospitals increased in the last year from 1,856,650 to 1,907,772. A decrease of 906 occurred in the maternity hospitals and 525 in other groups. The general hospitals had 96.8 per cent of the births, the maternity hospitals 3.1 per cent and the other hospitals less than 0.1 per cent. For convenience of reference a table has also been included showing hospital births classified by states.

Hospital Births Classified by States

	Births		Births

NURSING PERSONNEL IN HOSPITALS

The detailed study of nursing personnel reported in The Journal, March 31, 1945, was again carried out in the present survey. All registered hospitals were requested to supply the following information with reference to schools of nursing education and professional and auxiliary nursing personnel:

Professional Nursing Personnel (Number of *graduate* nurses)

1. Supt. and asst. supt. of hospital (nurse)....... ....
2. Supt. and assist. supt. of nurses and/or nursing school ....
3. Full time instructors........................ ....
4. Supervisors and asst. supervisors (night and day) ....
   (Charge of more than one ward unit)
5. Head nurses and asst. head nurses............ ....
   (Charge of one ward unit only)
6. Graduate general duty nurses (full time)...... ....
7. Graduate general duty nurses (part time)...... ....
8. Private duty nurses now in hospital........... ....
9. Other graduate nurses not classified above.... ....
10. Total graduate nurses........................ ....
   (Check that each nurse is listed in *one* classification only)

Auxiliary Nursing Personnel: Practical nurses, attendants etc. (spend major time assisting with nursing duties)..............

Volunteer nurses' aids...... Orderlies...... Ward maids......

Schools of Nursing

Do you have a state accredited school of nursing? If so, give number of student nurses now enrolled...... Do you conduct a state accredited school offering an affiliating course only?...... Number of students in this course......

The information compiled from this study is presented in tabular form under the headings of Nursing Personnel and Schools of Nursing Education, and Professional and Auxiliary Personnel. Included in the latter table are comparative data on beds, average census and admissions so that personnel ratios may be computed in relation to the various groups and hospitals represented. These indicate that in the latter part of 1945 the registered hospitals were employing 144,724 graduate nurses exclusive of 25,277 private duty nurses. The corresponding figures for 1944 were 125,458 and 23,949. Of the regular nursing staff, 8,488 were classified as administrative personnel, that is, superintendents and assistant superintendents of hospitals, nurses and/or nursing schools, 4,174 as full time instructors, 18,786 as supervisors and assistant supervisors, 26,769 as head nurses and assistant head nurses, 68,902 as full time general duty nurses, 11,826 as part time general duty nurses and 5,779 as unclassified. In comparison with 1944 there were fewer nurses in the unclassified group, but all other classifications of professional nursing personnel were increased in number. It should be noted, however, that the data on superintendents of hospitals, nurses and nursing schools in the 1944 report did not include assistant superintendents and therefore should not be compared directly with the administrative nursing personnel listed in the present survey. Increases were noted in all auxiliary nursing groups except in relation to practical nurses and attendants whose numbers decreased by approximately 8,000.

SCHOOLS OF NURSING EDUCATION

In connection with the present survey, state accredited schools of nursing reported a student enrolment of 130,909 as compared with 129,879 in 1944 and 110,222 in 1943. The number of schools accredited by the respective state boards of nurse examiners total 1,250 exclusive of the state accredited schools which offer an affiliating course only. The latter, comprising a group of 171 schools, accommodated 11,238 affiliated student nurses in 1945.

In the listing of accredited schools in the Hospital Register, two symbols are employed to differentiate between institutions conducting schools and those which supply training on an affiliated basis. The circular symbol (°) refers to hospitals which provide acceptable supplementary training in a limited field as, for example, pediatrics, psychiatry, tuberculosis or contagious diseases. The diamond symbol (◊), however, is applied to accredited schools of nursing operated by hospitals individually or under joint hospital and college or university sponsorship.

TECHNICAL PERSONNEL IN HOSPITALS

Hospital reports on technical personnel employed have been tabulated by states and included in The Journal on March 27, 1937, March 28, 1942, March 27, 1943, March 25, 1944 and March 31, 1945. Totals for previous years are appended to the current table for comparison. The variations in employment of technical personnel in hospitals during the war years are clearly demonstrated if the 1941 totals are used for comparison. During the war civilian and federal hospitals have experienced large increases in the number of patients admitted as demonstrated elsewhere in this issue. This is reflected in the increased employment of technical personnel to aid in establishing diagnoses, administering treatments or caring for the patients as well as keeping the necessary records. It is noteworthy that two changes occurred in hospital employment of technical personnel during 1945. There was a reduction of part time employment in all categories included in the accompanying table. Increase in full time employment was reported in those classifications in which personnel were particularly difficult to acquire during the war years. Thus the largest net increase was reported in the occupational therapist group, which represented an increase of 636 additional full time workers with only 24 fewer part time employees. Increased reliance on full time physical therapists was indicated by hospital reports this year which included 496 more full time physical therapists than last year with a reduction of 164 on a part time basis.

Medical stenographers totaled 775 more full time and 466 fewer part time than last year but since many of these individuals are employed in record departments the question arises whether or not a more accurate type of reporting is influencing these totals. A net increase of nurse anesthetists was experienced in 1945. Unfortunately the 1941 survey did not include nurse anesthetists and therefore figures are not available for a peacetime year.

The remaining categories demonstrate a net reduction was reported in the current survey. Changes in the number of clinical laboratory technicians in hospitals were not significant but a real reduction of 310 x-ray technicians and 262 pharmacists was recorded. These decreases are the first to have occurred since 1941 and represent 3 per cent of the 1944 peak employment of x-ray technicians in hospitals and 6 per cent of pharmacists reported in the same year.

In the current survey a reduction of 67 full time and 188 part time medical record librarians was reported, but this might easily reflect an alteration in the classification of personnel in record departments.

INTERNSHIPS AND RESIDENCIES

ADDITIONAL RESIDENCIES APPROVED

The following residency training programs have been approved since the publication of the latest list of Approved Residencies and Fellowships in THE JOURNAL, Sept. 29, 1945. Those designated with an asterisk (*) have been granted temporary approval in accordance with the plan announced in THE JOURNAL, March 2, 1946, p. 586.

ADDITIONAL RESIDENCIES APPROVED

Anesthesia

*Passavant Memorial Hospital	Chicago
*Beverly Hospital	Beverly, Mass.
*Boston City Hospital	Boston
Faulkner Hospital	Boston
Newton-Wellesley Hospital	Newton, Mass.
*Salem Hospital	Salem, Mass.
City of Detroit Receiving Hospital	Detroit
*Beth Israel Hospital	New York City
*Rochester General Hospital	Rochester, N. Y.
*Mount Sinai Hospital	Cleveland
St. Luke's Hospital	Cleveland
Starling-Loving University Hospital	Columbus O.
*Lankenau Hospital	Philadelphia
*Bishop DeGoesbriand Hospital	Burlington, Vt.
Mary Fletcher Hospital	Burlington, Vt.
*U. S. Naval Hospital	St. Albans, N. Y.

Dermatology and Syphilology

Colorado General Hospital	Denver
*Michael Reese Hospital	Chicago
*Passavant Memorial Hospital	Chicago
Massachusetts Memorial Hospitals	Boston
Ancker Hospital	St. Paul
*Hospital for Joint Diseases	New York City
*St. Luke's Hospital	New York City
Presbyterian Hospital	Pittsburgh
Cleveland Clinic Foundation Hospital	Cleveland
John Sealy Hospital	Galveston, Tex.
*U. S. Naval Hospital	Philadelphia

Medicine

*Samuel Merritt Hospital	Oakland, Calif.
*Delaware Hospital	Wilmington, Del.
Memorial Hospital	Wilmington, Del.
*Alexian Bros. Hospital	Chicago
Illinois Masonic Hospital	Chicago
*Methodist Hospital	Indianapolis
*Beverly Hospital	Beverly, Mass.
*New England Deaconess Hospital	Boston
*Salem Hospital	Salem, Mass.
Research Hospital	Kansas City, Mo.
*Methodist Hospital	Brooklyn
*Beth Israel Hospital	New York City
Roosevelt Hospital	New York City
Charlotte Memorial Hospital	Charlotte, N. C.
Toledo Hospital	Toledo, O.
*Emanuel Hospital	Portland, Ore.
*Hospital of the Protestant Episcopal Church	Philadelphia
Western Pennsylvania Hospital	Pittsburgh
*Rhode Island Hospital	Providence, R. I.
*Methodist Hospital	Dallas, Tex.
*St. Paul's Hospital	Dallas, Tex.
*Alexandria Hospital	Alexandria, Va.
*Johnston-Willis Hospital	Richmond, Va.
*Swedish Hospital	Seattle, Wash.
U. S. Marine Hospital	Baltimore
U. S. Naval Hospital	Bethesda, Md.
U. S. Naval Hospital	Philadelphia

Mixed

Boulder-Colorado Sanitarium and Hospital	Boulder, Colo.
Alton Memorial Hospital	Alton, Ill.
Cottage Hospital	Grosse Pointe, Mich.
St. Luke's Hospital	Richmond, Va.

Neurosurgery

Montefiore Hospital for Chronic Diseases	New York City

Obstetrics-Gynecology

*Samuel Merritt Hospital (ObG)	Oakland, Calif.
*St. Luke's Hospital (ObG)	Denver
*Hartford Hospital (ObG)	Hartford, Conn.
Illinois Masonic Hospital (ObG)	Chicago
*Ravenswood Hospital (ObG)	Chicago

Obstetrics-Gynecology—Continued

St. Joseph Hospital (Gyn)	Chicago
*St. Mary of Nazareth Hospital (ObG)	Chicago
*Swedish Covenant Hospital (ObG)	Chicago
Wesley Memorial Hospital (Gyn)	Chicago
*Evanston Hospital (ObG)	Evanston, Ill.
St. Francis Hospital (ObG)	Evanston, Ill.
Hospital for Women of Maryland (Ob)	Baltimore
*St. Agnes Hospital (ObG)	Baltimore
*West Baltimore General Hospital (ObG)	Baltimore
*St. Joseph's Mercy Hospital (ObG)	Ann Arbor, Mich.
*Beth Israel Hospital (Ob)	New York City
*Bronx Hospital (Ob)	New York City
*Lenox Hill Hospital (Gyn)	New York City
Highland Hospital (Ob)	Rochester, N. Y.
Rochester General Hospital (Ob)	Rochester, N. Y.
*City Hospital (ObG)	Akron, O.
*Peoples Hospital (Ob)	Akron, O.
*Aultman Hospital (ObG)	Canton, O.
Lutheran Hospital (Ob)	Cleveland
Starling-Loving University Hospital (Ob)	Columbus, O.
*Toledo Hospital (ObG)	Toledo, O.
*Emanuel Hospital (ObG)	Portland, Ore.
*Germantown Dispensary and Hospital (ObG)	Philadelphia
*Jewish Hospital (ObG)	Philadelphia
*Providence Lying-In Hospital (Ob)	Providence, R. I.
*Methodist Hospital (Ob)	Memphis, Tenn.
*St. Joseph Hospital (ObG)	Memphis, Tenn.
*Harris Memorial Methodist Hospital (ObG)	Fort Worth, Tex.
*Dr. W. H. Groves Latter-Day Saints Hospital (ObG)	Salt Lake City
Salt Lake County General Hospital (ObG)	Salt Lake City
*Swedish Hospital (ObG)	Seattle, Wash.
*Virginia Mason Hospital (ObG)	Seattle, Wash.
*Milwaukee Hospital (ObG)	Milwaukee
Kapiolani Maternity and Gynecological Hospital (Ob)	Honolulu, Hawaii
U. S. Naval Hospital (ObG)	Chelsea, Mass.
U. S. Naval Hospital (ObG)	Brooklyn
U. S. Naval Hospital (ObG)	Norfolk, Va.
U. S. Naval Hospital (ObG)	Portsmouth, Va.

Ophthalmology

University of Nebraska Hospital	Omaha

Orthopedic Surgery

Highland-Alameda County Hospital	Oakland, Calif.
Samuel Merritt Hospital	Oakland, Calif.
*Stanford University Hospitals	San Francisco
*Santa Clara County Hospital	San Jose, Calif.
*St. Luke's Hospital	Denver
*Corwin Hospital	Pueblo, Colo.
*Hartford Hospital	Hartford, Conn.
*Evanston Hospital	Evanston, Ill.
St. Francis .	Evanston, Ill.
Indianapolis	Indianapolis
*University of	Kansas City, Kan.
*Touro Infirmary	New Orleans

FACILITIES FOR RESIDENCY TRAINING

In 1941, under normal peacetime conditions, the hospitals approved for residency training provided facilities for 5,256 residents. After the war began, it soon became apparent, however, that many additional residencies would be required when medical officers returned to continue the education interrupted or delayed by call to military service. To help meet this need the Council on Medical Education and Hospitals instituted in November 1942 a study of graduate and postgraduate educational facilities in the United States, urging at the same time that additional residencies be developed in hospitals which had not yet reached their full educational capacity. Hospitals expressed an earnest desire to participate in this program and many began at once to formulate plans for the development of new residencies or the expansion of educational services already in operation. By October 1945 the number of approved residencies offered in civilian hospitals had increased to 7,666 and with the addition of recent approvals as listed above the total is now 8,043. This, it should be noted, represents an increase of 53.2 per cent, as compared with the number of residencies in 1941. Since October 1945, 269 additional residency training programs have been approved, as shown on pages 1086 and 1087. These include 162 which have been granted temporary approval in accordance with the plan described in the adjoining column. The newly approved services can accommodate 377 resident physicians. Reference should be made to the accompanying table showing distribution of residencies in relation to the various specialties.

Approved Residencies Classified by Specialties

(Civilian Hospitals Only)

Specialty	Hospitals Approved	Number of Residents
Anesthesiology	69	226
Cardiology	7	10
Communicable Diseases	18	72
Dermatology and Syphilology	45	136
Fractures	5	15
Malignant Diseases	17	73
Medicine	270	1,281
Mixed *	84	231
Neurology	31	111
Neurosurgery	34	93
Obstetrics and Gynecology	234	766
Ophthalmology and Otolaryngology	125	582
Orthopedic Surgery	147	386
Pathology	223	469
Pediatrics	142	517
Physical Medicine	10	22
Plastic Surgery	5	9
Psychiatry	143	637
Radiology	203	430
Surgery	330	1,452
Thoracic Surgery	22	47
Traumatic Surgery	3	4
Tuberculosis	93	324
Urology	82	210
Totals	2,342 †	8,043

* All hospitals approved for internships are also accredited for mixed residencies.
† Number of residency programs in hospitals.

Residency type of training is also being developed in hospitals of the Army, Navy, U. S. Public Health Service and Veterans Administration. Information regarding these programs has been published in previous issues of The Journal.

TEMPORARY APPROVAL OF RESIDENCIES

With the increased demand for residency training in recent months, large numbers of applications have been submitted by hospitals seeking Council approval of newly organized educational programs. To make these facilities available to physician veterans without undue delay, the Council has instituted a plan for the temporary approval of such residencies as give satisfactory indication that training can be maintained in accordance with present standards. The plan has been developed in collaboration with the Advisory Board for Medical Specialties and has already been approved by nearly all of the specialty boards.

It should be noted that temporary approval is not automatic; each application will be carefully evaluated on the basis of information supplied as well as previous knowledge of the hospital service. Only if the representatives of the Council and of the Board are reasonably satisfied that the educational program fulfils the requirements for residency training will temporary approval be extended. The following procedure has been adopted:

1. The Council on Medical Education and Hospitals of the American Medical Association has temporarily delegated to its secretary the authority to grant temporary residency approval on behalf of the Council subject to concurrence by the appropriate American board as described in No. 2.

2. Each participating American board has appointed representatives (usually one individual for each board) to consider new residencies for temporary approval with authority to act on behalf of the board.

3. Temporary approval will be based on information from the hospital concerning the personnel, facilities and educational program of the hospital service involved without immediate inspection. Such approval will be granted only if the representatives of the Council and of the board are reasonably satisfied that the educational program fulfils the standards of both bodies.

4. Subsequently, employing the usual procedures, an inspection of the hospital will be carried out by the Council's staff. On the basis of inspection report, the Council will consider the temporarily approved hospital for transfer to the regularly approved list in the usual manner. The inspection report and the recommendations of the Council will be submitted to the appropriate board, and the board will return its concurrence or disagreement with the Council. The result of this procedure would be either (*a*) transfer of the temporarily approved residency to a fully approved status or (*b*) withdrawal of the temporary approval.

5. In the event of withdrawal of temporary approval and failure to grant regular approval, credit toward board certification will be given to physicians for that part of their training received while the residency was on a temporary approval status. After such withdrawal of approval, residents seeking board certification will be given a reasonable time to obtain another acceptable residency without loss of time credit. This means that no resident would be penalized so far as board credit is concerned for time spent in a temporarily approved residency.

In seeking approval by the Council on Medical Education and Hospitals, those hospitals which organize new residencies should initially make no distinction between regular versus temporary approval. Applications should be transmitted to the Council in the regular manner. In the immediate future most, if not all, applications will be considered at once for temporary approval. The Council's staff will proceed with regular inspections as rapidly as possible so that transfer of acceptable hospital residencies from the temporarily approved to the regular approved list will take place as rapidly as possible if the inspection report seems to warrant such transfer in the opinion of the representatives of the Council and of the American board concerned.

RECONVERSION OF INTERNSHIPS AND RESIDENCIES

The withdrawal of intern and residency quotas from all hospitals on April 1, 1946 as announced by the Procurement and Assignment Service[1] marks the return of hospital educational services to a peacetime status. With this change as well as the return of medical officers to former staff positions, it may be anticipated that many hospitals will reorganize their educational programs for interns and residents, institute new residencies in various departments and reestablish those which remained inactive during the war because of quota limitations or reduction in teaching staff. When adequate clinical and teaching facilities are available such expansion will be of direct benefit to physician veterans as it will lead to further opportunities for residency training.

In November 1945 the Procurement and Assignment Service[2] announced its plan for the reconversion of the 9-9-9 program. Under this plan the commissioned officers scheduled to complete their nine months internship on April 1 would be permitted to continue their training until July 1, 1946. It was stated, however, that if hospitals were unable to accommodate these men as well as the new interns appointed for April 1, the commissioned officers who completed their nine months of intern training would be called to active duty. A subsequent directive specified also that requests for extension of individual internships through the additional three months period would need to be submitted by February 1. Since one of the main purposes of the reconversion program was to reestablish the peacetime status of twelve months internships beginning each July the new interns appointed April 1, 1946 will be permitted to continue until July 1, 1947.

It was also the purpose of the reconversion plan to provide more residency positions for returning medical officers and hospitals were urged to begin at once to appoint veterans to the house staff so that every military resident and assistant resident could be called to active duty on or before April 1, 1946. The discontinuance of deferments beyond the intern level has made available to veterans many additional places and as time goes on an increasing number of positions will be filled by returned medical officers, who now constitute practically the only source of supply for the future residency appointments.

The Council in cooperation with the specialty boards will lend every effort to aid the establishment of additional high grade educational programs so that all veterans who wish to continue their residency training may have an opportunity to obtain an acceptable hospital appointment. The expansion of residency programs by over 53 per cent since 1941 as well as the present numbers of applications for Council approval is clear indication of the desire of hospitals to make their facilities available for the continued training of physician veterans.

HOSPITAL INTERNSHIP

There are at the present time within the continental limits of the United States 1,096 civilian hospitals approved by the American Medical Association for intern and/or residency training. Of this total 395 are approved for internships only, 376 for both internships and residencies and 371 exclusively for residencies in specialties. Considered separately, the hospitals approved for internships total 743 and the hospitals approved for residencies 764. It should be noted, however, that all hospitals approved for intern training are likewise accredited for mixed residencies which are in the main similar to second year internships.

The hospitals approved for intern training can accommodate 8,427 interns as shown in the accompanying table. The reports indicate that 5,587 interns are in training, 4,851 serving in rotating assignments, 128 on mixed services and 608 in straight internships. With the termination of the 9-9-9 program the hospitals are now returning to the regular twelve months internships. Although several hospitals had 18 or 24 months services before the war it is anticipated that most internships will continue as one year assignments followed by assistant residencies and residencies for those who desire additional hospital training either of a general or special character. As hospitals return to a peacetime basis a reorganization of the internship will occur in many institutions. In this connection the Council will be glad to assist hospitals in the planning of educational activities and the organization of individual training programs.

APPOINTMENT OF INTERNS

The following plan for the appointment of interns whose services will begin July 1, 1947 has been approved by a Joint Committee of the American Hospital Association, Association of American Medical Colleges, Council on Medical Education and Hospitals of the American Medical Association, American Protestant Hospital Association and Catholic Hospital Association of the United States and Canada. The plan applies only to July 1, 1947 appointments and will be modified for later internships. It provides that applications for internships should be submitted in accordance with the following principles:

1. Applications and credentials for internships to begin by July 1, 1947 should not be released by the medical schools nor received by the hospitals before June 1, 1946. Credentials include letters of recommendation, summaries of scholastic records from the dean's office, transcripts of records and recommendations of college faculties.
2. Hospitals should not issue appointments to interns, either written or verbal, before July 1, 1946.
3. The prospective intern's acceptance or rejection of such appointment shall reach the hospital on or before July 8, 1946.
4. Medical school teaching staffs will very carefully refrain from conversations with their clinical clerks which may be interpreted as promises of internship appointment.

It is strongly urged that all medical schools and hospitals cooperate on the basis of the principles just described. The plan can be successful only if there is complete cooperation by all concerned.

NECROPSY PERFORMANCE

The correlation of clinical and pathologic material has long been recognized as one of the most important functions in the training of interns. The lack of pathologic material therefore, or the failure to utilize available facilities to the fullest extent will seriously impair the quality of house staff instruction. The accompanying table illustrates the volume of necropsy performance in approved internship hospitals for various years since 1926. Here it will be noted that the continued increase in necropsy rates which culminated in the report of 1941 was followed by a reduction in the first war years. An encouraging report was obtained in 1944 and still further increase was observed in the present study. The fact that 328 hospitals have rates of 30 per cent or over and that in this group 26 have attained the level of 70 per cent is evidence of the earnest desire on the part of hospitals and medical staffs to maintain the highest quality of educational service for interns and resident physicians.

Necropsy Performance in Approved Intern Hospitals

26. Loretto Hospital, Chicago	Church	70.1

* Does not include federal hospitals approved for intern training.

It is of further interest to note that in the ten year period from 1936 to 1945, a total of sixty-seven nonfederal hospitals have attained the highly commendable necropsy rate of 70 per cent or over. Three hospitals in this group were above the 70 per cent level in ten successive years while two had a similar record for nine years, two for eight years and two for seven years. Nine hospitals were included in six of the ten years, three appeared in the list five times, while four attained this level four times. Of the other hospitals seven were listed three separate years, eleven two years and twenty-four once. It is particularly significant that this record of achievement is shared widely by general hospitals of various classifications. Of the sixty-seven hospitals, for example, thirty-six are listed as nonprofit associations, fourteen as church related hospitals, eight under state control, two under county management, four municipal, two city-county and one under corporate ownership unrestricted as to profit.

The accomplishment of these hospitals is evidence of wholehearted cooperation on the part of the hospital administration, medical staff, hospital pathologist, resident physicians, interns and other personnel associated with hospital educational programs. This record should serve as an incentive to other hospitals that have been less successful in their program of necropsy performance. For many years the average necropsy rate in hospitals approved by the Council for the training of interns has been over 35 per cent.

HOSPITALS REGISTERED BY THE AMERICAN MEDICAL ASSOCIATION

The following list contains the names of 6,511 hospitals, sanatoriums and related institutions that are located in the United States and 123 in Alaska, Canal Zone, Hawaii, Puerto Rico and Virgin Islands. The list for each state is presented in two groups: (1) hospitals and sanatoriums, and (2) related institutions. The related institutions include infirmaries, nursing homes and other institutions designed to give certain medical and nursing care in an ethical and acceptable manner, without giving a full hospital service.

Registration of hospitals is governed by the Essentials of a Registered Hospital, adopted by the House of Delegates in 1928 and revised in 1939.

Registration is a basic recognition, extended to all the hospitals and related institutions in the following list, concerning which we have no evidence of irregular or unsafe practices. *Approval* is designation of certain registered institutions by the Council on Medical Education and Hospitals for internships, residencies and fellowships; or by the American College of Surgeons as unconditionally meeting its minimum requirements for general standardization.

KEY TO SYMBOLS AND ABBREVIATIONS

★ Approved for training interns by the Council on Medical Education and Hospitals. List with detailed information is sent on request.

✚ Approved for residencies or fellowships. List with detailed information is sent on request.

▲ Approved by American College of Surgeons as meeting unconditionally its minimum requirements for general standardization

◇ School of nursing accredited by state board of nurse examiners.

○ Affiliated for nurse training on state accredited basis.

† Figures for "average census" and "admissions" are exclusive of newborn infants.

The column headed "Type of Service" tells what diseases are treated in each institution:

Card	Cardiac	ENT	Eye, ear, nose and throat	Iso	Isolation	N&M	Nervous and mental
Chil	Children	Gen	General	Mat	Maternity	Orth	Orthopedic
Chr	Chronic	Incur	Incurable	MatCh	Maternity and children	SkCa	Skin and cancer
Conv	Convalescent and rest	Indus	Industrial	MeDe	Mentally deficient	TB	Tuberculosis
Drug	Drug and alcoholic	Inst	Institutional	Ment	Mental	Ven	Venereal
Epil	Epileptic						

The column headed "Control" indicates control, or auspices under which the institution is conducted:

GOVERNMENTAL			NONPROFIT ORGANIZATIONS		PROPRIETARY	
Fed	Federal	State	Church		Indiv	Individual
IA	Indian Affairs	City	NPAssn	Nonprofit Association	Part	Partnership
Army	United States Army	County			Corp	Corporation (unrestricted as to profit)
Navy	United States Navy	City County				
USPHS	United States Public Health Service	CyCo				
Vet	Veterans Administration					

The accompanying list omits additions to hospital facilities that may have been made by certain departments of the Federal Government since the publication of the issue of March 15, 1941.

Corrections were made in the list to the time of going to press. Totals of the list, therefore, may vary from totals in Tables 1 and 2 which were necessarily compiled earlier.
